

## License Server 4.0 changing location of backup files

Changing location of the Backup file for License Server to a different machine.

License Server is running on Internet Information Service, therefore the true User Id is prefixed by IUSR\_ and the machine name you are using for License Server. When writing the file to a backup machine you must indicate on the backup machine the IUSR\_machinename as a valid ID (in User Manager) giving it "write privileges."

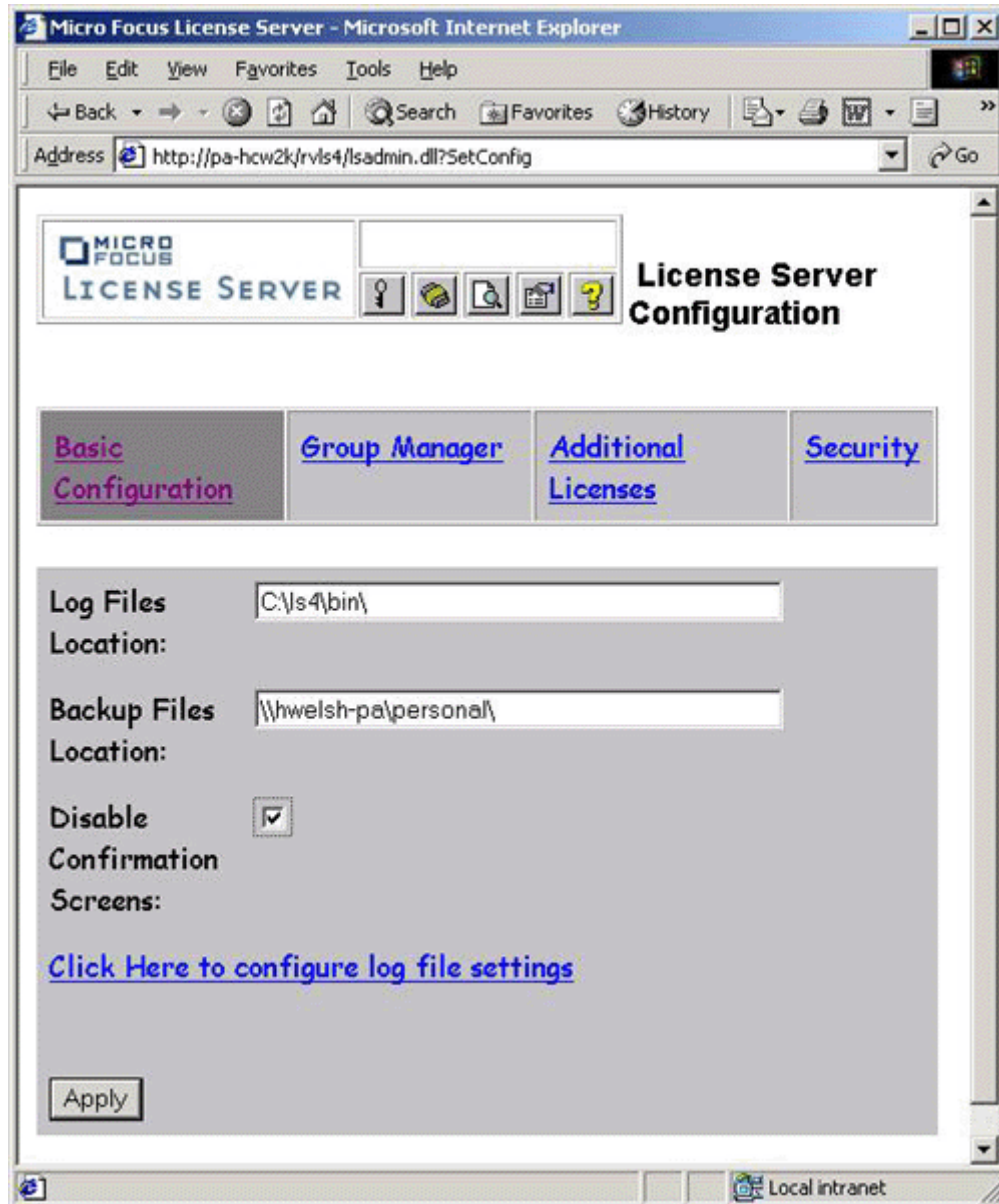

The next step is to go into the Internet Information Services, highlight the virtual directory for the license server, go to Properties, click on the Directory Security Tab, Click on EDIT button for Anonymous access, make sure you have the domain/userid and password entered with "Allow IIS to control password" is UNCHECKED.

You should now go to Services, stop and start services for IIS Admin, World Wide Web and the LS Timer services.

Restart License Server 4.0, go to Configuration screen and change the location of the backup file:

## License Server 4.0 changing location of backup files

Click on Apply and you should then get a message that states that the Backup Files Location has been saved.

Purpose of doing this will be to secure the ls4.arc file from integrity issues and losing the server machine.
