

LOADING CA7 JOB STREAM INFORMATION into REVOLVE

In order to view job stream information in Revolve, you must load the information in a form that Revolve can understand, which is XML. The job stream information can be written in native XML and loaded into Revolve, but the easier way is to convert the CA7 information into XML using the following process.

The LJOB command is run on the mainframe using JCL. The output should be RECFM=FB,LRECL=132. (Contact SupportLine for JCL to run the LJOB command if needed.)

```
Test.str - Notepad
File Edit Search Help
BSTR-00 *** INPUT TO BATCH TERMINAL ***

/LOGON *****
LJOB,JOB=TESTJOB,LIST=ALL
/LOGOFF
BSTR-00 *** END OF INPUT ***
02098 161649 /LOGON *****

#1 - Output of the LJOB command

At this point, the output from this job is added into Revolve with an extension of STR, using a TYPE stream. Do not MAKE the project yet. The STR file is not yet parsed at this point. Select the entire Streams folder, or a specific stream file, and click on options from the tool bar.

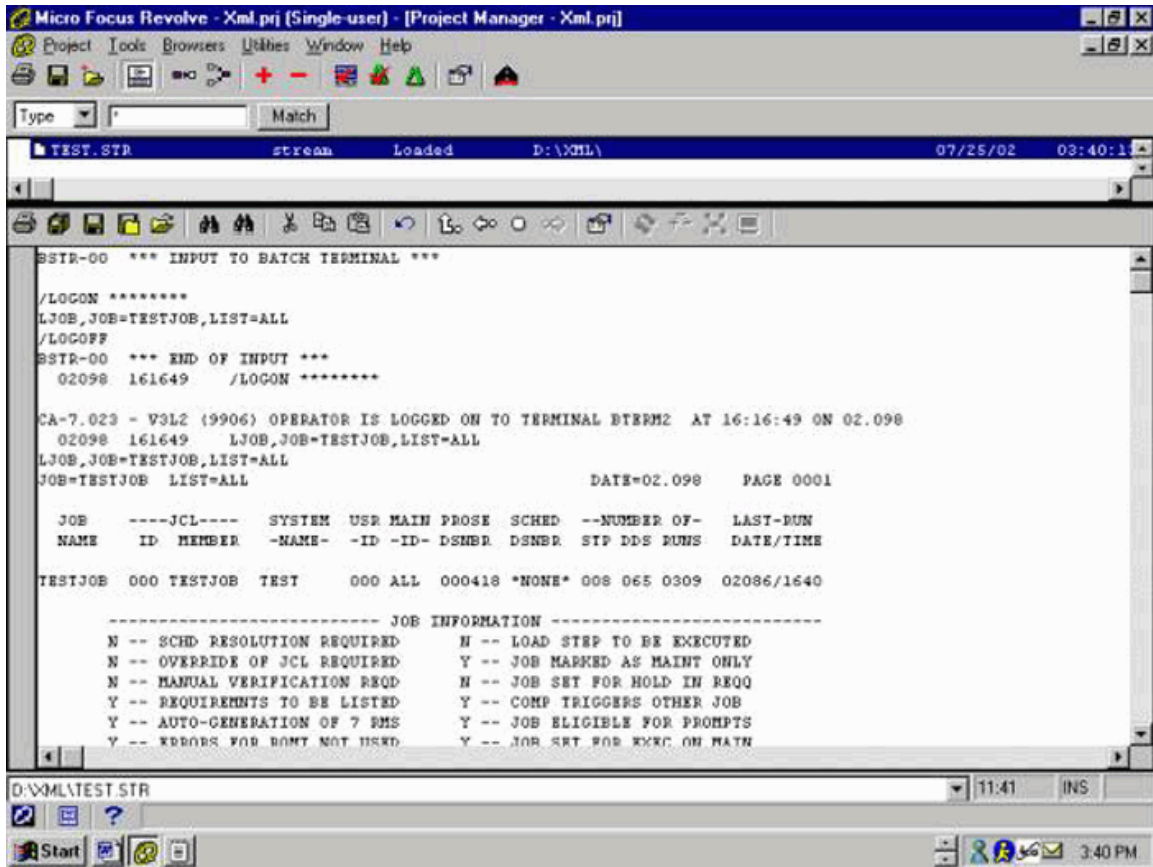

LOADING CA7 JOB STREAM INFORMATION into REVOLVE

#2 Stream file options.

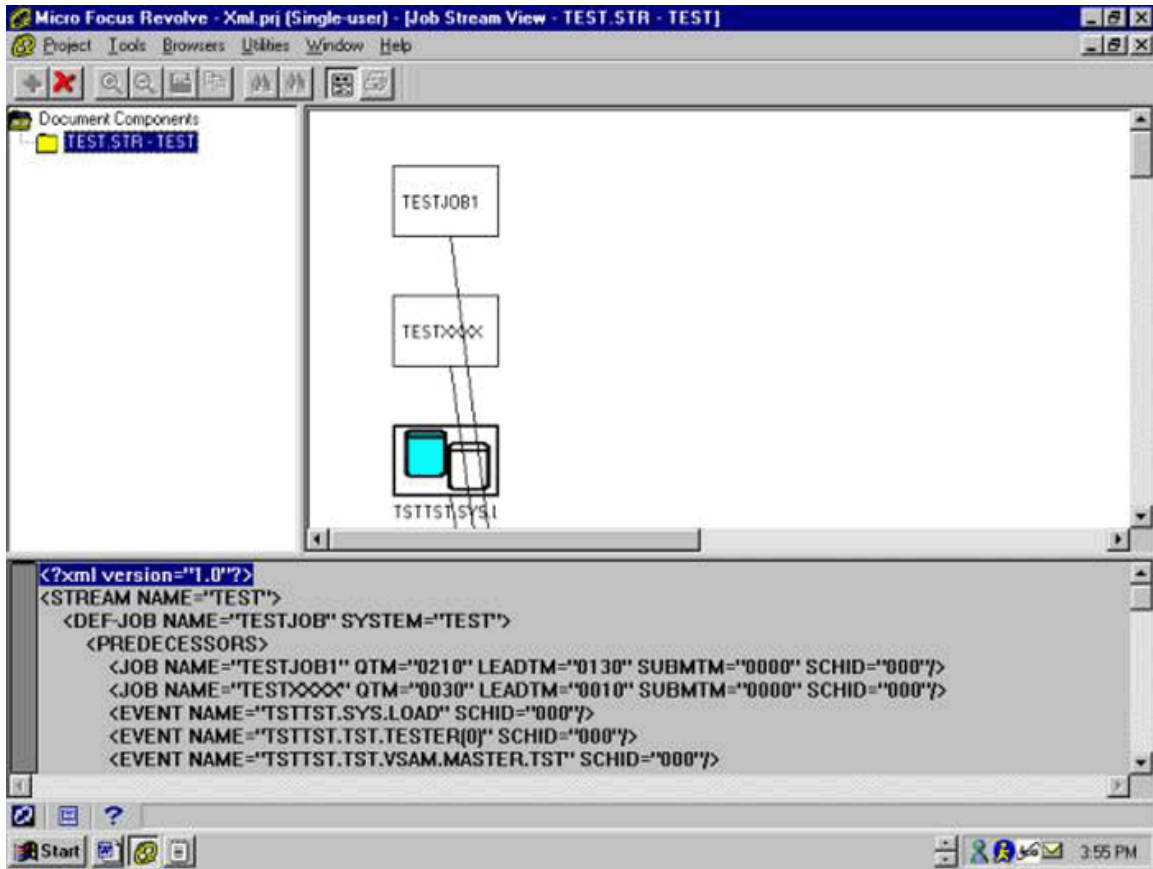

In the Preprocessor box, enter RVPRECA7.DLL, and click OK. Now you can MAKE the project. You will see the preprocessor box pop up on the screen as the STR file is being parsed. The Stream file is now parsed and ready to view in the Job Stream Viewer.

LOADING CA7 JOB STREAM INFORMATION into REVOLVE

#3 - The Stream file is now parsed and loaded. The original LJOB output is shown in the source view from Project Manager.

LOADING CA7 JOB STREAM INFORMATION into REVOLVE

#4 - The Job Stream view shows both the job stream diagram and the XML code.
