Fortify Code Security Extension for Visual Studio Code Patch Release Notes

Software Version: 26.2.2

Software Release Date: June 12, 2026

Document Release Date: June 12, 2026

Fortify Code Security Extension for Visual Studio Code

The OpenText Fortify Code Security Extension for Visual Studio Code provides an integrated application security workflow inside Visual Studio Code to support early identification and remediation of vulnerabilities. Use the OpenText Fortify Code Security Extension for Visual Studio Code to authenticate, select target applications, run scans, and remediate findings across OpenText Core Application Security and Application Security Center.

New features

This patch includes the following features for Fortify Code Security Extension for Visual Studio Code:

- Enhanced certificate validation by prompting users to review and install self-signed SSL certificate during authentication to Application Security Center.

Fixed issues

The patch includes bug fixes and quality enhancements that improve application stability in Fortify Code Security Extension for Visual Studio Code:

- Fixed an issue where creating an application in Application Security Center failed when mandatory custom attributes of type Integer or Date were configured in Application Security Center.

Note

You must update the fcli to version 3.20.0.

Known issues

- When a OpenText Core Application Security and Application Security Center session is created through the Command Palette by running the `fccli` command, the **Refresh** button in the extension does not update the displayed login status.
- Saved OpenText Core Application Security and Application Security Center session credentials persist even after the Fortify Code Security extension is uninstalled and reinstalled.
- After setting a preferred platform (OpenText Core Application Security or Application Security Center) in the extension settings, the **Quick Links** section does not correctly filter the quick links based on the selected platform.
- When executing certain fccli commands using the **Execute via Dialog** option, the extension displays the fccli help page in the **Output** console if the dialog contains required fields.
- When users click options in the Fortify Code Security sidebar before completing required prerequisite steps, the extension does not display an appropriate validation or guidance message.
- When executing a fccli command using the **Execute via Dialog** option, the entered data is cleared once the command completes and results are displayed.
- When using the `FCli SSC create-template` or `FCli FoD create-template` command via the Command Palette, the **Template Path** field is not auto-populated and does not provide suggestions or a file selection option.
- When remediating and auditing Core Application Security vulnerabilities, selecting an **Assigned User** is mandatory. Otherwise, the audit fails.
- In Core Application Security remediation workflow, the **Pending Review** status is not available in the **Auditor Status** list. The **Auditor Status** list reflects values from the Core Application Security portal level instead of being scoped to the release level.

Support
