Connector Framework Server

Software Version 12.4

Administration Guide

MICRO FOCUS

Document Release Date: October 2019
Software Release Date: October 2019

Legal notices

Copyright notice

The only warranties for products and services of Micro Focus and its affiliates and licensors (“Micro Focus”) are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. Micro Focus shall not be liable for technical or editorial errors or omissions contained herein. The information contained herein is subject to change without notice.

Documentation updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for updated documentation, visit https://www.microfocus.com/support-and-services/documentation/.

Support

Visit the MySupport portal to access contact information and details about the products, services, and support that Micro Focus offers.

This portal also provides customer self-solve capabilities. It gives you a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the MySupport portal to:

- Search for knowledge documents of interest
- Access product documentation
- View software vulnerability alerts
- Enter into discussions with other software customers
- Download software patches
- Manage software licenses, downloads, and support contracts
- Submit and track service requests
- Contact customer support
- View information about all services that Support offers

Many areas of the portal require you to sign in. If you need an account, you can create one when prompted to sign in. To learn about the different access levels the portal uses, see the Access Levels descriptions.

About this PDF version of online Help

This document is a PDF version of the online Help.

This PDF file is provided so you can easily print multiple topics or read the online Help.

Because this content was originally created to be viewed as online help in a web browser, some topics may not be formatted properly. Some interactive topics may not be present in this PDF version. Those topics can be successfully printed from within the online Help.

Contents

Chapter 1: Introduction

This section provides an overview of Connector Framework Server.

Connector Framework Server

Connector Framework Server (CFS) processes the information that is retrieved by connectors, and then indexes the information into one or more indexes, such as IDOL Server.

Connectors send information to CFS in the form of documents. A *document* is a collection of metadata and, usually, an associated source file. The metadata describes the location of the file or record that was retrieved, and other information that was extracted by the connector. For example, a document sent for ingestion by a Web Connector includes the URL of the page and the links that were extracted from the page when it was crawled. The Web Connector provides the downloaded HTML in an associated file so that it can be processed by CFS.

Sometimes a document does not have an associated source file. For example, if you retrieve information from a database using the ODBC Connector, the documents sent for ingestion contain the information extracted by your chosen query, and might not have an associated file. These documents are referred to as having *metadata only*.

CFS uses KeyView to extract information from the source file. Some source files are container files, such as zip archives, and these are extracted. CFS then uses KeyView to obtain text and file-specific metadata from the file, and adds it to the document. The original source file is discarded before the document is indexed. This allows IDOL to search and categorize documents, and perform other operations, without needing to process the information from a repository in its native format.

CFS provides features to manipulate and enrich documents. For example, you can send media files to an IDOL Media Server and perform tasks such as optical character recognition and face recognition. This adds additional information to the IDOL document, so that when a user queries IDOL the results include relevant images, audio, and video files. CFS also supports the Lua scripting language so that you can write your own tasks and develop custom processing rules.

A single CFS can process information from any number of connectors. For example, a CFS might process files retrieved by a File System Connector, web pages retrieved by a Web Connector, and e-mail messages retrieved by an Exchange Connector. Alternatively, you or an application can send information to CFS directly.

Filter Documents and Extract Subfiles

CFS uses KeyView to extract meaningful information from the files retrieved by a connector. KeyView can extract the file content, metadata, and subfiles from over 1,000 different file types.

- *File content* is the main content of a file, for example the body of an e-mail message.
- *Metadata* is information about a file itself, for example the sender of an e-mail message or the date and time when it was received.
- *Subfiles* are files that are contained within the main file. For example, an e-mail message might contain embedded images or attachments that you want to index.

Manipulate and Enrich Documents

CFS provides features to manipulate and enrich documents. *Enriching* a document means adding additional information, or improving the quality and usefulness of the information, before the document is indexed into IDOL. For example, you can:

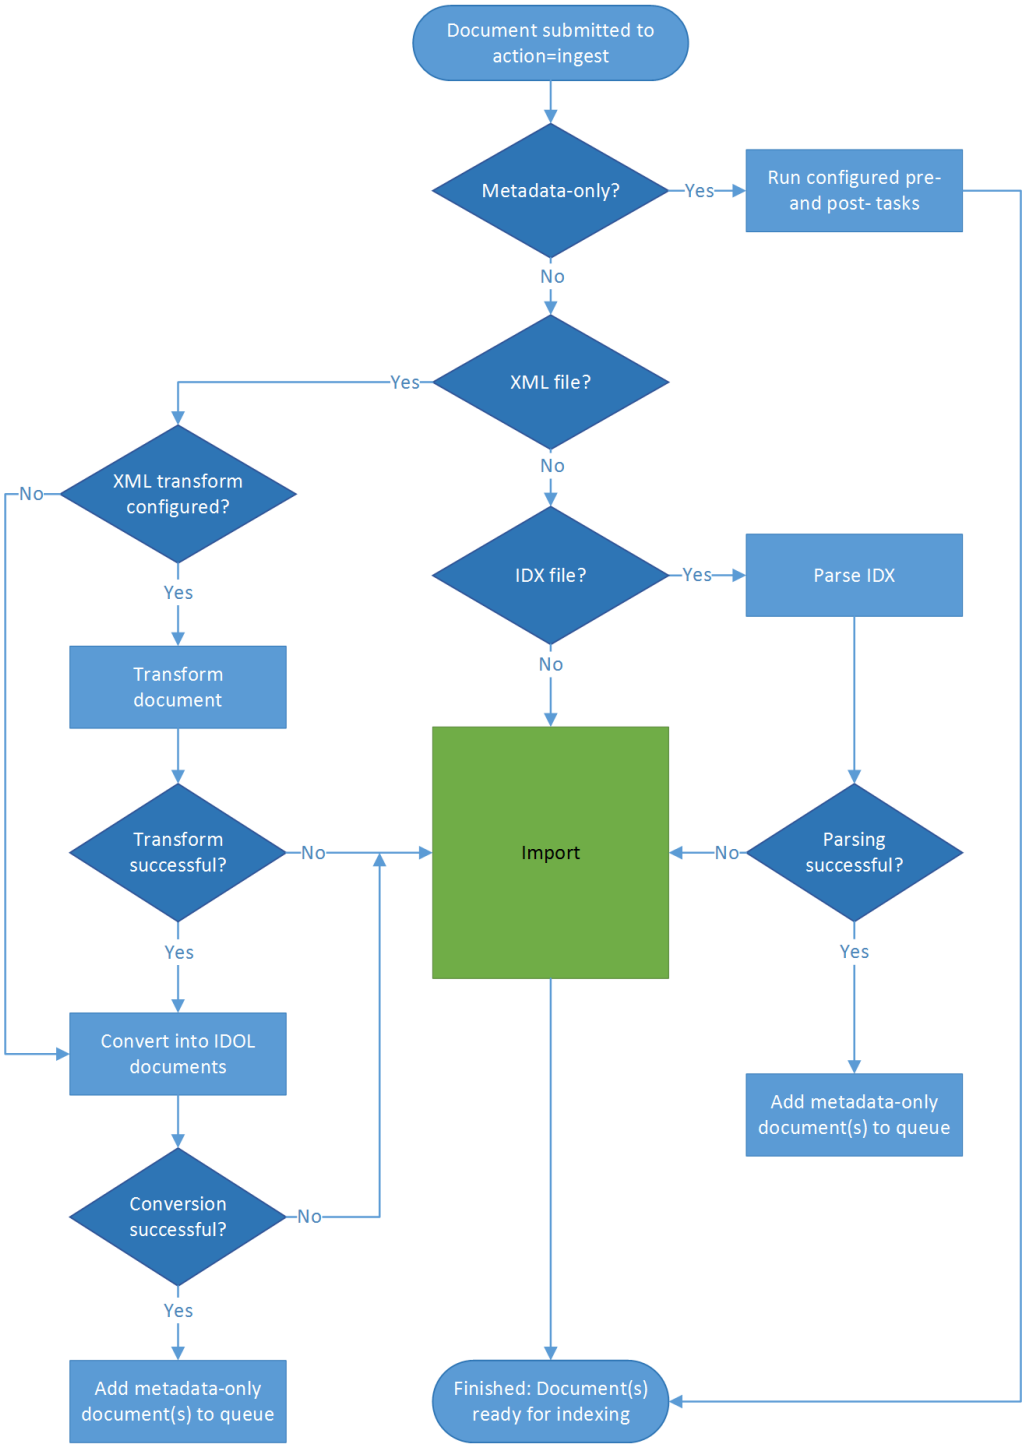
- Add additional fields to a document.
- Extract content from HTML pages, discarding irrelevant content such as headers, sidebars, advertisements, and scripts.
- Split long documents into multiple sections. This can improve performance when you query IDOL, because IDOL can return a specific part of a document in response to a query.
- Standardize field names, so that documents that originated from different repositories use the same fields to store the same type of information.
- Perform *Eduction* on document fields. Eduction extracts *entities* from a document, and writes them to specific document fields. An entity can be a word, phrase, or block of information - for example an address or telephone number.
- Perform analysis on image and video files and add the results to the document. Examples of media analysis include optical character recognition (OCR), face detection and recognition, and object recognition. To analyze media you must have an IDOL Media Server.
- Extract speech from audio and video files, and add the transcription to the document content. To analyze speech you must have an IDOL Speech Server.
- Reject documents that do not contain content in a specific language.

The simplest way to manipulate documents is to use the *import tasks* that are included with CFS. For information about the tasks that are available, see Manipulate and Enrich Documents, on page 50. You can configure these tasks by modifying configuration parameters in the CFS configuration file.

CFS also supports Lua, an embedded scripting language. You can write Lua scripts to manipulate documents and define custom processing rules. For information about the Lua functions that are provided with CFS, refer to the *Connector Framework Server Reference*.

The Ingestion Process

The following chart provides a summary of the ingestion process.



Documents are submitted to Connector Framework Server through the `ingest` action. If the document has metadata only, CFS runs any processing tasks that have been configured and the document is then ready for indexing. If the document has an associated file then the ingestion process depends on the file format.

- **All files apart from IDOL IDX and XML**. Most documents that have an associated file are added to the import queue so that the information in the file can be extracted by KeyView or other processing tasks. For information about the import process, see The Import Process, on the next page.
- **IDOL IDX files**. An IDX file contains one or more documents in IDOL IDX format, so CFS attempts to parse the file. If parsing is successful then the IDOL documents are returned to the ingest queue as metadata-only documents. If parsing is not successful then CFS adds the document to the import queue so that the IDX file is processed by KeyView. Parsing an IDX file is preferable to processing it with KeyView, because although KeyView can extract the text, it cannot extract the structure information that divides the text into separate documents, content sections, and metadata fields.
- **XML files**. Many systems export information in XML format and CFS has features to help you convert XML into IDOL documents.

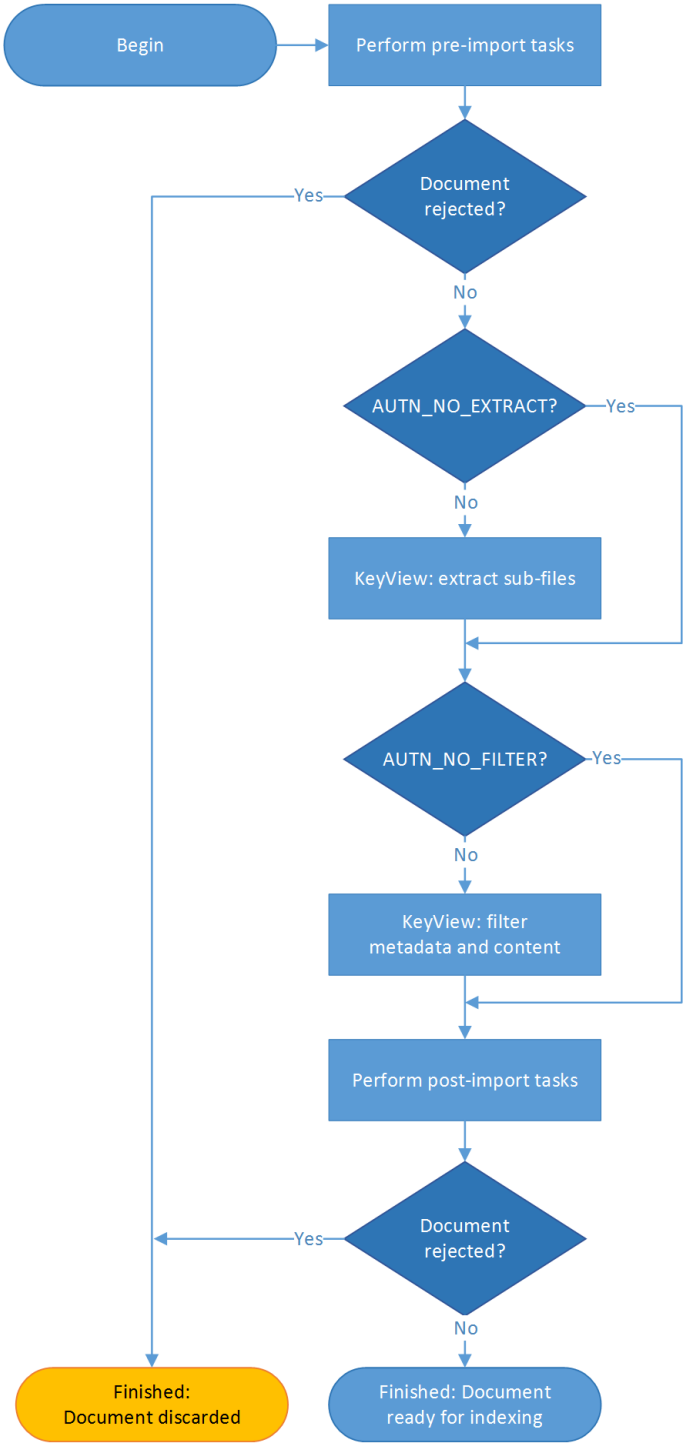
  CFS can run a transformation on an ingested XML file. This is an optional step but can be useful in cases where your XML files do not resemble IDOL documents or you are processing XML from many sources and the files have different schemas. You can configure any number of transformations and CFS runs the first transformation where the ingested XML matches the specified schema. You can also configure a default transformation that CFS runs when an XML file does not match any of your schemas. When a transformation is configured but is not successful, CFS adds the document to the import queue so that the XML is processed by KeyView.

  After an XML transformation is successful or when transformation is not configured, CFS attempts to convert the XML into IDOL documents. The conversion is performed by mapping elements in the XML to IDOL documents and document fields. If the conversion is successful the resulting documents are returned to the ingest queue as metadata-only documents. If the conversion does not result in any IDOL documents but the XML was transformed after matching a schema, CFS does not consider this as a failure and does not index any documents. Otherwise, CFS adds the document to the import queue so that the XML is processed by KeyView.

  Parsing an XML file is usually preferable to processing it with KeyView, because although KeyView can extract the text it does not preserve the structure information (the XML tags are discarded).

The Import Process

The following chart provides a summary of the import process.



1. CFS takes a document from the import queue.
2. CFS performs the pre-import tasks that are configured in its configuration file. Pre-import tasks occur before files are processed by KeyView. You can use pre-import tasks to manipulate and enrich documents (see Manipulate and Enrich Documents, on page 10). Sometimes it is important to run tasks before KeyView processing. For example, if you send an audio file to Media Server for analysis, you might not want to process it with KeyView.

   > **TIP:** Both pre- and post-import tasks can reject a document, so that it is discarded and not indexed. You might configure CFS to reject a document if the associated file does not contain useful content. Documents are not rejected when an import task fails - in that case CFS continues processing the document.

3. Unless the document contains the metadata field `AUTN_NO_EXTRACT`, CFS uses KeyView to extract sub-files. Examples of files that have sub-files include e-mail messages (which have attachments) and zip files (which contain other files). CFS creates a new document for each sub-file and adds the new documents to the import queue to be processed separately.
4. Unless the document contains the metadata field `AUTN_NO_FILTER`, CFS uses KeyView to filter the associated source file. Filtering extracts the text from a file. An office document is likely to contain useful text, while an archive file (for example a zip file) or a media file is unlikely to have textual content.

   > **TIP:** Although media files (images, audio, and video) do not contain text, you can extract useful information by sending the files to an IDOL Media Server.

5. CFS performs the post-import tasks that are configured in its configuration file.
6. Processing is complete and the document is ready to be indexed.

Index Documents

After CFS finishes processing documents, it automatically indexes them into one or more indexes. You can index documents into:

- **IDOL Server** (or send them to a *Distributed Index Handler*, so that they can be distributed across multiple IDOL servers).
- **Vertica**.

The IDOL Platform

At the core of Connector Framework Server is the *Intelligent Data Operating Layer* (IDOL).

IDOL gathers and processes unstructured, semi-structured, and structured information in any format from multiple repositories using IDOL connectors and a global relational index. It can automatically form a contextual understanding of the information in real time, linking disparate data sources together based on the concepts contained within them. For example, IDOL can automatically link concepts contained in an email message to a recorded phone conversation, that can be associated with a stock

trade. This information is then imported into a format that is easily searchable, adding advanced retrieval, collaboration, and personalization to an application that integrates the technology.

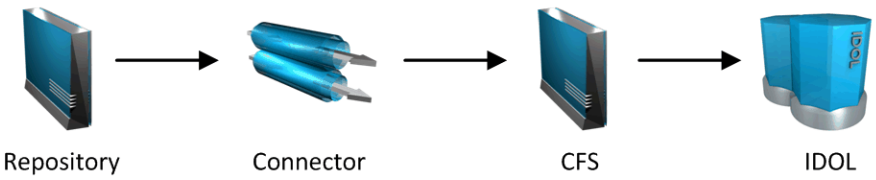
For more information on IDOL, see the *IDOL Getting Started Guide*.

System Architecture

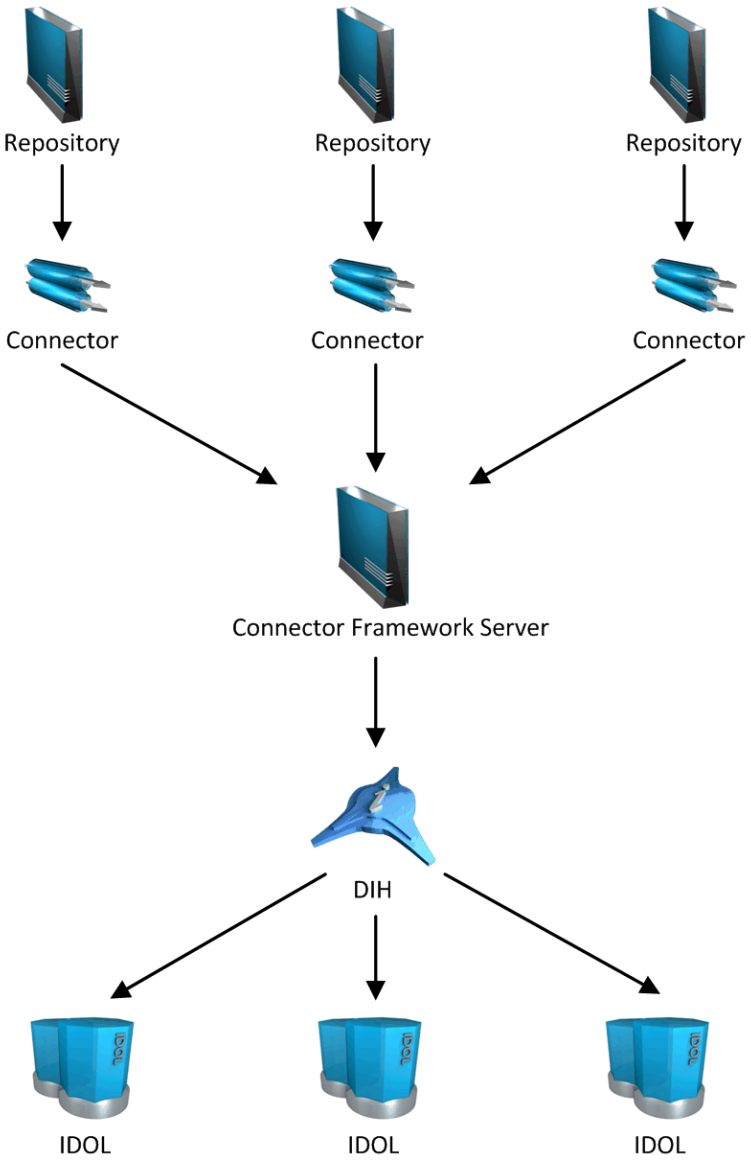
An IDOL infrastructure can include the following components:

- **Connectors**. Connectors extract data from repositories and send the data to CFS.
- **Connector Framework Server**.
- **IDOL Server**. IDOL Server provides features to analyze unstructured information and extract meaning from that information.
- **Distributed Index Handler (DIH)**. The Distributed Index Handler distributes data across multiple IDOL servers. Using multiple IDOL servers can increase the availability and scalability of the system.

These components can be installed in many different configurations. The simplest installation consists of a single connector, a single CFS, and a single IDOL server.



A more complex configuration might include more than one connector, or use a Distributed Index Handler (DIH) to index content across multiple IDOL servers.



OEM Certification

Connector Framework Server works in OEM licensed environments.

Related Documentation

The following documents provide more details on Connector Framework Server.

- *Connector Framework Server Reference*

  The *Connector Framework Server Reference* describes the configuration parameters and actions that are supported by CFS.

- *IDOL Server Administration Guide*

  The *IDOL Server Administration Guide* describes the operations that IDOL Server can perform, and describes how to set them up.

- *Distributed Index Handler (DIH) Administration Guide*

  This guide describes how you can use a DIH to distribute aggregated documents across multiple IDOL Servers.

- *License Server Administration Guide*

  This guide describes how to use a License Server to license multiple IDOL services.

Display Online Help

You can display the Connector Framework Server Reference by sending an action from your web browser. The Connector Framework Server Reference describes the actions and configuration parameters that you can use with Connector Framework Server.

For Connector Framework Server to display help, the help data file (`help.dat`) must be available in the installation folder.

To display help for Connector Framework Server

1. Start Connector Framework Server.
2. Send the following action from your web browser:

   `http://`*`host`*`:`*`port`*`/action=Help`

   where:

   `host` is the IP address or name of the machine on which Connector Framework Server is installed.

   `port` is the ACI port by which you send actions to Connector Framework Server (set by the `Port` parameter in the `[Server]` section of the configuration file).

   For example:

   ```
   http://12.3.4.56:9000/action=help
   ```

Chapter 2: Configure Connector Framework Server

This section describes how to configure CFS.

Connector Framework Server Configuration File

To configure CFS, modify the configuration file. The file is located in the CFS installation folder and can be modified with a text editor.

The parameters in the configuration file are divided into sections that represent CFS functionality. CFS supports standard Server, Service, Logging, and License parameters.

Service Section

The `[Service]` section specifies the service port used by CFS.

Server Section

The `[Server]` section specifies the ACI port of the Connector Framework Server. When you configure connectors, the `IngestPort` parameter in the connector configuration file should point to this port.

Actions Section

The `[Actions]` section specifies how CFS processes actions that are sent to the ACI port.

Logging Section

The `[Logging]` section contains configuration parameters that determine how messages are logged. You can create separate log streams for different message types. The configuration file also contains a section to configure each of the log streams.

Indexing Section

The `[Indexing]` section specifies the host name or IP address, and port, of machines where data is sent after it has been processed by CFS. This is usually the IP address and ACI port of an IDOL Server. You can use other indexing parameters to specify how data is indexed.

ImportService Section

The `[ImportService]` section specifies details for KeyView.

ImportTasks Section

The `[ImportTasks]` section is used to set up custom import tasks. CFS performs these tasks on data before it is indexed into IDOL Server. For more information about Import Tasks, see Manipulate and Enrich Documents, on page 50.

IndexTasks Section

The `[IndexTasks]` section is used to set up custom index tasks. IDOL connectors detect when documents are updated or removed from a repository. The connectors pass this information to CFS so that the documents can be updated or removed from IDOL Server. When CFS receives this information, it can perform custom Index tasks before the information is sent to IDOL. For more information about Index tasks, see Manipulate and Enrich Documents, on page 50.

Related Topics

Modify Configuration Parameter Values

You modify Connector Framework Server configuration parameters by directly editing the parameters in the configuration file. When you set configuration parameter values, you must use UTF-8.

> **CAUTION:** You must stop and restart Connector Framework Server for new configuration settings to take effect.

This section describes how to enter parameter values in the configuration file.

Enter Boolean Values

The following settings for Boolean parameters are interchangeable:

```
TRUE = true = ON = on = Y = y = 1
```

```
FALSE = false = OFF = off = N = n = 0
```

Enter String Values

To enter a comma-separated list of strings when one of the strings contains a comma, you can indicate the start and the end of the string with quotation marks, for example:

ParameterName=**cat,dog,bird,"wing,beak",turtle**

Alternatively, you can escape the comma with a backslash:

ParameterName=**cat,dog,bird,wing\,beak,turtle**

If any string in a comma-separated list contains quotation marks, you must put this string into quotation marks and escape each quotation mark in the string by inserting a backslash before it. For example:

ParameterName=**"<font face=\"arial\" size=\"+1\"><b>","<p>"**

Here, quotation marks indicate the beginning and end of the string. All quotation marks that are contained in the string are escaped.

Configure Connector Framework Server

This section describes how to configure CFS.

To configure CFS

1. Stop CFS, if it is running.
2. Open the CFS configuration file.
3. In the `[Service]` section, specify the service port:

`ServicePort`	The port for CFS to use as the service port.

4. In the `[Server]` section, set the ACI port:

`Port`	The port for CFS to use as the ACI port.

5. (Optional) In the `[ImportService]` section, you can set parameters to configure KeyView. You can choose the number of threads to use, specify the folders to use for extracting files, and

customize how documents are imported.

`ThreadCount`	The number of threads to use for importing documents.

For information about the configuration parameters that you can set, refer to the *Connector Framework Server Reference*.

6. Save the configuration file.

- Connector Framework Server Configuration File, on page 18
- Customize Logging, on page 115

Include an External Configuration File

You can share configuration sections or parameters between ACI server configuration files. The following sections describe different ways to include content from an external configuration file.

You can include a configuration file in its entirety, specified configuration sections, or a single parameter.

When you include content from an external configuration file, the `GetConfig` and `ValidateConfig` actions operate on the combined configuration, after any external content is merged in.

In the procedures in the following sections, you can specify external configuration file locations by using absolute paths, relative paths, and network locations. For example:

```
../sharedconfig.cfg
K:\sharedconfig\sharedsettings.cfg
\\example.com\shared\idol.cfg
file://example.com/shared/idol.cfg
```

Relative paths are relative to the primary configuration file.

> **NOTE:** You can use nested inclusions, for example, you can refer to a shared configuration file that references a third file. However, the external configuration files must not refer back to your original configuration file. These circular references result in an error, and Connector Framework Server does not start.
>
> Similarly, you cannot use any of these methods to refer to a different section in your primary configuration file.

Include the Whole External Configuration File

This method allows you to import the whole external configuration file at a specified point in your configuration file.

To include the whole external configuration file

1. Open your configuration file in a text editor.
2. Find the place in the configuration file where you want to add the external configuration file.
3. On a new line, type a left angle bracket (<), followed by the path to and name of the external configuration file, in quotation marks (""). You can use relative paths and network locations. For example:

   ```
   < "K:\sharedconfig\sharedsettings.cfg"
   ```

4. Save and close the configuration file.

Include Sections of an External Configuration File

This method allows you to import one or more configuration sections (including the section headings) from an external configuration file at a specified point in your configuration file. You can include a whole configuration section in this way, but the configuration section name in the external file must exactly match what you want to use in your file. If you want to use a configuration section from the external file with a different name, see Merge a Section from an External Configuration File, on the next page.

To include sections of an external configuration file

1. Open your configuration file in a text editor.
2. Find the place in the configuration file where you want to add the external configuration file section.
3. On a new line, type a left angle bracket (<), followed by the path of the external configuration file, in quotation marks (""). You can use relative paths and network locations. After the configuration file path, add the configuration section name that you want to include. For example:

   ```
   < "K:\sharedconfig\extrasettings.cfg" [License]
   ```

   > **NOTE:** You cannot include a section that already exists in your configuration file.

4. Save and close the configuration file.

Include Parameters from an External Configuration File

This method allows you to import one or more parameters from an external configuration file at a specified point in your configuration file. You can import a single parameter or use wildcards to specify multiple parameters. The parameter values in the external file must match what you want to use in your file. This method does not import the section heading, such as `[License]` in the following examples.

To include parameters from an external configuration file

1. Open your configuration file in a text editor.
2. Find the place in the configuration file where you want to add the parameters from the external configuration file.
3. On a new line, type a left angle bracket (<), followed by the path of the external configuration file, in quotation marks (""). You can use relative paths and network locations. After the configuration file path, add the name of the section that contains the parameter, followed by the parameter name. For example:

   ```
   < "license.cfg" [License] LicenseServerHost
   ```

   To specify a default value for the parameter, in case it does not exist in the external configuration file, specify the configuration section, parameter name, and then an equals sign (=) followed by the default value. For example:

   ```
   < "license.cfg" [License] LicenseServerHost=localhost
   ```

   You can use wildcards to import multiple parameters, but this method does not support default values. The * wildcard matches zero or more characters. The ? wildcard matches any single character. Use the pipe character | as a separator between wildcard strings. For example:

   ```
   < "license.cfg" [License] LicenseServer*
   ```

4. Save and close the configuration file.

Merge a Section from an External Configuration File

This method allows you to include a configuration section from an external configuration file as part of your Connector Framework Server configuration file. For example, you might want to specify a standard SSL configuration section in an external file and share it between several servers. You can use this method if the configuration section that you want to import has a different name to the one you want to use.

To merge a configuration section from an external configuration file

1. Open your configuration file in a text editor.
2. Find or create the configuration section that you want to include from an external file. For example:

   ```
   [SSLOptions1]
   ```

3. After the configuration section name, type a left angle bracket (<), followed by the path to and name of the external configuration file, in quotation marks (""). You can use relative paths and network locations. For example:

   ```
   [SSLOptions1] < "../sharedconfig/ssloptions.cfg"
   ```

If the configuration section name in the external configuration file does not match the name that you want to use in your configuration file, specify the section to import after the configuration file name. For example:

```
[SSLOptions1] < "../sharedconfig/ssloptions.cfg" [SharedSSLOptions]
```

In this example, Connector Framework Server uses the values in the `[SharedSSLOptions]` section of the external configuration file as the values in the `[SSLOptions1]` section of the Connector Framework Server configuration file.

> **NOTE:** You can include additional configuration parameters in the section in your file. If these parameters also exist in the imported external configuration file, Connector Framework Server uses the values in the local configuration file. For example:
>
> ```
> [SSLOptions1] < "ssloptions.cfg" [SharedSSLOptions]
> SSLCACertificatesPath=C:\IDOL\HTTPConnector\CACERTS\
> ```

4. Save and close the configuration file.

Encrypt Passwords

Micro Focus recommends that you encrypt all passwords that you enter into a configuration file.

Create a Key File

A key file is required to use AES encryption.

To create a new key file

1. Open a command-line window and change directory to the Connector Framework Server installation folder.
2. At the command line, type:

   ```
   autpassword -x -tAES -oKeyFile=./MyKeyFile.ky
   ```

   A new key file is created with the name `MyKeyFile.ky`

> **CAUTION:** To keep your passwords secure, you must protect the key file. Set the permissions on the key file so that only authorized users and processes can read it. Connector Framework Server must be able to read the key file to decrypt passwords, so do not move or rename it.

Encrypt a Password

The following procedure describes how to encrypt a password.

To encrypt a password

1. Open a command-line window and change directory to the Connector Framework Server

installation folder.

2. At the command line, type:

   `autpassword -e -t`*`EncryptionType`* `[-oKeyFile] [-c`*`FILE`* `-s`*`SECTION`* `-p`*`PARAMETER`*`] `*`PasswordString`*

   where:

Option	Description
`-t` *`EncryptionType`*	The type of encryption to use: • **`Basic`** • **`AES`** For example: **`-tAES`** **NOTE:** AES is more secure than basic encryption.
`-o`*`KeyFile`*	AES encryption requires a key file. This option specifies the path and file name of a key file. The key file must contain 64 hexadecimal characters. For example: **`-oKeyFile=./key.ky`**
`-cFILE -sSECTION -pPARAMETER`	(Optional) You can use these options to write the password directly into a configuration file. You must specify all three options. • **`-c`**. The configuration file in which to write the encrypted password. • **`-s`**. The name of the section in the configuration file in which to write the password. • **`-p`**. The name of the parameter in which to write the encrypted password. For example: **`-c./Config.cfg -sMyTask -pPassword`**
`PasswordString`	The password to encrypt.

   For example:

   `autpassword -e -tBASIC `*`MyPassword`*

   `autpassword -e -tAES -oKeyFile=./key.ky `*`MyPassword`*

   `autpassword -e -tAES -oKeyFile=./key.ky -c./Config.cfg -sDefault -pPassword `*`MyPassword`*

   The password is returned, or written to the configuration file.

Decrypt a Password

The following procedure describes how to decrypt a password.

To decrypt a password

1. Open a command-line window and change directory to the Connector Framework Server installation folder.
2. At the command line, type:

   `autpassword -d -t`*`EncryptionType`* `[-oKeyFile]` *`PasswordString`*

   where:

Option	Description
`-t` *`EncryptionType`*	The type of encryption: • **`Basic`** • **`AES`** For example: **`-tAES`**
`-oKeyFile`	AES encryption and decryption requires a key file. This option specifies the path and file name of the key file used to decrypt the password. For example: **`-oKeyFile=./key.ky`**
`PasswordString`	The password to decrypt.

   For example:

   ```
   autpassword -d -tBASIC 9t3M3t7awt/J8A
   ```

   ```
   autpassword -d -tAES -oKeyFile=./key.ky 9t3M3t7awt/J8A
   ```

   The password is returned in plain text.

Configure Client Authorization

You can configure Connector Framework Server to authorize different operations for different connections.

Authorization roles define a set of operations for a set of users. You define the operations by using the `StandardRoles` configuration parameter, or by explicitly defining a list of allowed actions in the `Actions` and `ServiceActions` parameters. You define the authorized users by using a client IP address, SSL identities, and GSS principals, depending on your security and system configuration.

For more information about the available parameters, see the *Connector Framework Server Reference*.

> **IMPORTANT:** To ensure that Connector Framework Server allows only the options that you

configure in `[AuthorizationRoles]`, make sure that you delete any deprecated *`Role`*`Clients` parameters from your configuration (where *`Role`* corresponds to a standard role name, for example `AdminClients`).

To configure authorization roles

1. Open your configuration file in a text editor.
2. Find the `[AuthorizationRoles]` section, or create one if it does not exist.
3. In the `[AuthorizationRoles]` section, list the user authorization roles that you want to create. For example:

   ```
   [AuthorizationRoles]
   0=AdminRole
   1=UserRole
   ```

4. Create a section for each authorization role that you listed. The section name must match the name that you set in the `[AuthorizationRoles]` list. For example:

   ```
   [AdminRole]
   ```

5. In the section for each role, define the operations that you want the role to be able to perform. You can set `StandardRoles` to a list of appropriate values, or specify an explicit list of allowed actions by using `Actions`, and `ServiceActions`. For example:

   ```
   [AdminRole]
   StandardRoles=Admin,ServiceControl,ServiceStatus

   [UserRole]
   Actions=GetVersion
   ServiceActions=GetStatus
   ```

   NOTE: The standard roles do not overlap. If you want a particular role to be able to perform all actions, you must include all the standard roles, or ensure that the clients, SSL identities, and so on, are assigned to all relevant roles.

6. In the section for each role, define the access permissions for the role, by setting `Clients`, `SSLIdentities`, and `GSSPrincipals`, as appropriate. If an incoming connection matches one of the allowed clients, principals, or SSL identities, the user has permission to perform the operations allowed by the role. For example:

   ```
   [AdminRole]
   StandardRoles=Admin,ServiceControl,ServiceStatus
   Clients=localhost
   SSLIdentities=admin.example.com
   ```

7. Save and close the configuration file.
8. Restart Connector Framework Server for your changes to take effect.

IMPORTANT: If you do not provide any authorization roles for a standard role, Connector

Framework Server uses the default client authorization for the role (localhost for `Admin` and `ServiceControl`, all clients for `Query` and `ServiceStatus`). If you define authorization only by actions, Micro Focus recommends that you configure an authorization role that disallows all users for all roles by default. For example:

```
[ForbidAllRoles]
StandardRoles=*
Clients=""
```

This configuration ensures that Connector Framework Server uses only your action-based authorizations.

Example Configuration File

This section contains an example configuration file, which meets the minimum configuration requirements.

```
[Service]
Port=17000

[Server]
Port=7000
MaxInputString=-1
MaxFileUploadSize=-1
XSLTemplates=TRUE

[AuthorizationRoles]
0=AdminRole
1=QueryRole

[AdminRole]
StandardRoles=admin,servicecontrol,query,servicestatus
Clients=::1,127.0.0.1

[QueryRole]
StandardRoles=query,servicestatus
Clients=*

[Actions]
MaxQueueSize=100

[Logging]
LogLevel=NORMAL
0=ApplicationLogStream
1=ActionLogStream
2=ImportLogStream
3=IndexLogStream
```

```
[ApplicationLogStream]
LogTypeCSVs=application
LogFile=application.log

[ActionLogStream]
LogTypeCSVs=action
LogFile=action.log

[ImportLogStream]
LogTypeCSVs=import
LogFile=import.log

Chapter 3: Start and Stop Connector Framework Server

This section describes how to start and stop CFS.

Start Connector Framework Server

This section describes how to start Connector Framework Server.

To start CFS on Windows

1. Open the Windows Services dialog box.
2. Select the **ConnectorFramework** service (you might have chosen a different name for the service during the installation process).
3. Click **Start**.
4. (*Optional*). To verify that CFS is ready, send the following action to the ACI port.

   `http://host:port/action=getstatus`

   A response is displayed.

To start CFS on UNIX

1. Change to the CFS installation directory.
2. Run the start script by using the following command.

   `./startconnectorFramework.sh`

Stop Connector Framework Server

This section describes how to stop Connector Framework Server.

To stop CFS on Windows

1. Open the Windows Services dialog box.
2. Select the **ConnectorFramework** service (you might have chosen a different name for the service during the installation process).
3. Click **Stop**, and close the Windows Services dialog box.

To stop CFS on UNIX

1. Change to the CFS installation directory.
2. Run the stop script by using the following command.

   ```
   ./stopconnectorFramework.sh
   ```

Chapter 4: Send Actions to Connector Framework Server

This section describes how to send actions to Connector Framework Server.

Send Actions to Connector Framework Server

Connector Framework Server actions are HTTP requests, which you can send, for example, from your web browser. The general syntax of these actions is:

`http://host:port/action=action&parameters`

where:

host	is the IP address or name of the machine where Connector Framework Server is installed.
port	is the Connector Framework Server ACI port. The ACI port is specified by the `Port` parameter in the `[Server]` section of the Connector Framework Server configuration file. For more information about the `Port` parameter, see the *Connector Framework Server Reference*.
action	is the name of the action you want to run.
parameters	are the required and optional parameters for the action.

> **NOTE:** Separate individual parameters with an ampersand (&). Separate parameter names from values with an equals sign (=). You must percent-encode all parameter values.

For more information about actions, see the *Connector Framework Server Reference*.

Asynchronous Actions

When you send an asynchronous action to Connector Framework Server, the CFS adds the task to a queue and returns a token. Connector Framework Server performs the task when a thread becomes

available. You can use the token with the `QueueInfo` action to check the status of the action and retrieve the results of the action.

Most of the actions sent to CFS are `ingest` actions, so when you use the `QueueInfo` action, query the `ingest` action queue, for example:

```
/action=QueueInfo&QueueName=ingest&QueueAction=GetStatus
```

Check the Status of an Asynchronous Action

To check the status of an asynchronous action, use the token that was returned by Connector Framework Server with the `QueueInfo` action. For more information about the `QueueInfo` action, refer to the *Connector Framework Server Reference*.

To check the status of an asynchronous action

- Send the `QueueInfo` action to Connector Framework Server with the following parameters.

`QueueName`	The name of the action queue that you want to check.
`QueueAction`	The action to perform. Set this parameter to **`GetStatus`**.
`Token`	(Optional) The token that the asynchronous action returned. If you do not specify a token, Connector Framework Server returns the status of every action in the queue.

For example:

```
/action=QueueInfo&QueueName=ingest&QueueAction=getstatus&Token=...
```

Cancel an Asynchronous Action that is Queued

To cancel an asynchronous action that is waiting in a queue, use the following procedure.

To cancel an asynchronous action that is queued

- Send the `QueueInfo` action to Connector Framework Server with the following parameters.

`QueueName`	The name of the action queue that contains the action to cancel.
`QueueAction`	The action to perform . Set this parameter to **`Cancel`**.
`Token`	The token that the asynchronous action returned.

For example:

```
/action=QueueInfo&QueueName=ingest&QueueAction=Cancel&Token=...
```

Stop an Asynchronous Action that is Running

You can stop an asynchronous action at any point.

To stop an asynchronous action that is running

- Send the `QueueInfo` action to Connector Framework Server with the following parameters.

`QueueName`	The name of the action queue that contains the action to stop.
`QueueAction`	The action to perform. Set this parameter to **`Stop`**.
`Token`	The token that the asynchronous action returned.

For example:

```
/action=QueueInfo&QueueName=ingest&QueueAction=Stop&Token=...
```

Store Action Queues in an External Database

Connector Framework Server provides asynchronous actions. Each asynchronous action has a queue to store requests until threads become available to process them. You can configure Connector Framework Server to store these queues either in an internal database file, or in an external database hosted on a database server.

The default configuration stores queues in an internal database. Using this type of database does not require any additional configuration.

You might want to store the action queues in an external database so that several servers can share the same queues. In this configuration, sending a request to any of the servers adds the request to the shared queue. Whenever a server is ready to start processing a new request, it takes the next request from the shared queue, runs the action, and adds the results of the action back to the shared database so that they can be retrieved by any of the servers. You can therefore distribute requests between components without configuring a Distributed Action Handler (DAH).

> **NOTE:** You cannot use multiple servers to process a single request. Each request is processed by one server.

Prerequisites

- Supported databases:
  - PostgreSQL 9.0 or later.
  - MySQL 5.0 or later.
- If you use PostgreSQL, you must set the PostgreSQL ODBC driver setting `MaxVarChar` to **`0`**

(zero). If you use a DSN, you can configure this parameter when you create the DSN. Otherwise, you can set the `MaxVarcharSize` parameter in the connection string.

Configure Connector Framework Server

To configure Connector Framework Server to use a shared action queue, follow these steps.

To store action queues in an external database

1. Stop Connector Framework Server, if it is running.
2. Open the Connector Framework Server configuration file.
3. Find the relevant section in the configuration file:
   - To store queues for all asynchronous actions in the external database, find the `[Actions]` section.
   - To store the queue for a single asynchronous action in the external database, find the section that configures that action.
4. Set the following configuration parameters.

`AsyncStoreLibraryDirectory`	The path of the directory that contains the library to use to connect to the database. Specify either an absolute path, or a path relative to the server executable file.
`AsyncStoreLibraryName`	The name of the library to use to connect to the database. You can omit the file extension. The following libraries are available: • **`postgresAsyncStoreLibrary`** - for connecting to a PostgreSQL database. • **`mysqlAsyncStoreLibrary`** - for connecting to a MySQL database.

`ConnectionString`	The connection string to use to connect to the database. The user that you specify must have permission to create tables in the database. For example:
	`ConnectionString=DSN=ActionStore`
	or
	`ConnectionString=Driver={PostgreSQL}; Server=10.0.0.1; Port=9876; Database=SharedActions; Uid=user; Pwd=password; MaxVarcharSize=0;`
	If your connection string includes a password, Micro Focus recommends encrypting the value of the parameter before

entering it into the configuration file. Encrypt the entire connection string. For information about how to encrypt parameter values, see Encrypt Passwords, on page 24.

For example:

```
[Actions]
AsyncStoreLibraryDirectory=acidlls
AsyncStoreLibraryName=postgresAsyncStoreLibrary
ConnectionString=DSN=ActionStore
```

5. You can use the same database to store action queues for more than one type of IDOL component (for example, a group of File System Connectors and a group of Media Servers). To use a database for more than one type of component, set the following parameter in the `[Actions]` section of the configuration file.

`DatastoreSharingGroupName`	The group of components to share actions with. You can set this parameter to any string, but the value must be the same for each server in the group. For example, to configure several Connector Framework Servers to share their action queues, set this parameter to the same value in every Connector Framework Server configuration. Micro Focus recommends setting this parameter to the name of the component. **CAUTION:** Do not configure different components (for example, two different types of connector) to share the same action queues. This will result in unexpected behavior.

For example:

```
[Actions]
...
DatastoreSharingGroupName=MediaServer
```

6. Save and close the configuration file.

   When you start Connector Framework Server it connects to the shared database.

Store Action Queues in Memory

Connector Framework Server provides asynchronous actions. Each asynchronous action has a queue to store requests until threads become available to process them. These queues are usually stored in a datastore file or in a database hosted on a database server, but in some cases you can increase performance by storing these queues in memory.

NOTE: Storing action queues in memory improves performance only when the server receives large numbers of actions that complete quickly. Before storing queues in memory, you should also

consider the following:

- The queues (including queued actions and the results of finished actions) are lost if Connector Framework Server stops unexpectedly, for example due to a power failure or the component being forcibly stopped. This could result in some requests being lost, and if the queues are restored to a previous state some actions could run more than once.
- Storing action queues in memory prevents multiple instances of a component being able to share the same queues.
- Storing action queues in memory increases memory use, so please ensure that the server has sufficient memory to complete actions and store the action queues.

If you stop Connector Framework Server cleanly, Connector Framework Server writes the action queues from memory to disk so that it can resume processing when it is next started.

To configure Connector Framework Server to store asynchronous action queues in memory, follow these steps.

To store action queues in memory

1. Stop Connector Framework Server, if it is running.
2. Open the Connector Framework Server configuration file and find the `[Actions]` section.
3. If you have set any of the following parameters, remove them:
   - `AsyncStoreLibraryDirectory`
   - `AsyncStoreLibraryName`
   - `ConnectionString`
   - `UseStringentDatastore`
4. Set the following configuration parameters.

`UseInMemoryDatastore`	A Boolean value that specifies whether to keep the queues for asynchronous actions in memory. Set this parameter to **`TRUE`**.
`InMemoryDatastoreBackupIntervalMins`	(Optional) The time interval (in minutes) at which the action queues are written to disk. Writing the queues to disk can reduce the number of queued actions that would be lost if Connector Framework Server stops unexpectedly, but configuring a frequent backup will increase the load on the datastore and might reduce performance.

For example:

```
[Actions]
UseInMemoryDatastore=TRUE
InMemoryDatastoreBackupIntervalMins=30
```

5. Save and close the configuration file.

   When you start Connector Framework Server, it stores action queues in memory.

Use XSL Templates to Transform Action Responses

You can transform the action responses returned by Connector Framework Server using XSL templates. You must write your own XSL templates and save them with either an `.xsl` or `.tmpl` file extension.

After creating the templates, you must configure Connector Framework Server to use them, and then apply them to the relevant actions.

To enable XSL transformations

1. Ensure that the `autnxslt` library is located in the same directory as Connector Framework Server. If the library is not included in your installation, you can obtain it from Micro Focus Support.
2. Open the Connector Framework Server configuration file in a text editor.
3. In the `[Server]` section, ensure that the `XSLTemplates` parameter is set to **`true`**.

   > **CAUTION:** If `XSLTemplates` is set to **`true`** and the `autnxslt` library is not present in the same directory as the configuration file, the server will not start.

4. (Optional) In the `[Paths]` section, set the `TemplateDirectory` parameter to the path to the directory that contains your XSL templates. The default directory is `acitemplates`.
5. Save and close the configuration file.
6. Restart Connector Framework Server for your changes to take effect.

To apply a template to action output

- Add the following parameters to the action:

`Template`	The name of the template to use to transform the action output. Exclude the folder path and file extension.
`ForceTemplateRefresh`	(Optional) If you modified the template after the server started, set this parameter to **`true`** to force the ACI server to reload the template from disk rather than from the cache.

  For example:

```
action=QueueInfo&QueueName=Ingest
                &QueueAction=GetStatus
                &Token=...
                &Template=myTemplate
```

In this example, Connector Framework Server applies the XSL template `myTemplate` to the response from an `Ingest` action.

> **NOTE:** If the action returns an error response, Connector Framework Server does not apply the XSL template.

Example XSL Templates

Connector Framework Server includes the following sample XSL templates, in the `acitemplates` folder:

XSL Template	Description
`LuaDebug`	Transforms the output from the `LuaDebug` action, to assist with debugging Lua scripts.

Chapter 5: Ingest Data

This section describes how to send data to CFS.

Ingest Data using Connectors

To configure a connector to send data to CFS, follow these steps.

To configure a connector to send data to CFS

1. Stop the connector, if it is running. For information about how to stop a connector, refer to the connector's documentation.
2. Open the connector's configuration file in a text editor.
3. In the `[Ingestion]` section, set the following parameters:

`EnableIngestion`	To enable ingestion, set this parameter to **`true`**.
`IngesterType`	To send data to CFS, set this parameter to **`CFS`**.
`IngestHost`	The host name or IP address of the CFS.
`IngestPort`	The ACI port of the CFS.

   For example:

```
[Ingestion]
EnableIngestion=True
IngesterType=CFS
IngestHost=localhost
IngestPort=7000
```

4. Save and close the configuration file.

   You can now start the connector.

Ingest an IDX File

You can ingest an IDX file using the `Ingest` action.

Use the `adds` parameter to specify the document that you want to ingest. This parameter takes XML like the following example which ingests `c:\data.idx`:

```
<adds>
   <add>
      <source filename="c:\data.idx" />
   </add>
</adds>
```

The XML must be URL encoded:

`http://`*`server`*`:`*`port`*`/action=ingest&adds=[`*`URL encoded XML`*`]`

For more information about the `Ingest` action, refer to the *Connector Framework Server Reference*.

Ingest XML

Many systems export information in XML format and CFS has features to help you convert XML into IDOL documents.

> **NOTE:** The XML must be encoded in UTF-8.

You can configure CFS to transform XML files, with an XSL transformation, before they are processed. This is an optional step but can be useful in cases where your XML files do not resemble IDOL documents or you are processing XML from many sources and the files have different schemas. You can configure any number of transformations and CFS runs the first transformation where the ingested XML matches the specified schema. You can also configure a default transformation that CFS runs when an XML file does not match any of your schemas.

After an XML file has been transformed, or when transformation is not configured, CFS attempts to convert the XML into IDOL documents. The XML is parsed according to the rules that you configure in the `[XmlParsing]` section of the CFS configuration file. If the conversion is successful, the resulting metadata-only documents are added to the ingest queue (for more information about the ingestion process, see The Ingestion Process, on page 11). If the conversion does not result in any IDOL documents but the XML was transformed after matching a schema, CFS does not consider this as a failure and does not index any documents. Otherwise, for example if the XML is invalid, the XML file is added to the import queue so that it is processed by KeyView along with other file types.

Transform XML Files

CFS can transform XML files before attempting to parse them. XSL transformations are configured in the `[XmlTransformation]` section of the CFS configuration file.

To run a single transformation, you can specify the settings in the `[XmlTransformation]` section:

```
[XmlTransformation]
ValidationSchema=schema.xsd
TransformationStylesheet=transform.xslt
```

In this example, CFS uses the stylesheet `transform.xslt` to transform any XML file that matches `schema.xsd`.

If you are processing XML files that have more than one schema, you might want to configure several transformations. To do this, use the `Sections` parameter to specify the names of sections that configure the transformations:

```
[XmlTransformation]
Sections=XmlTransform1,XmlTransform2

[XmlTransform1]
ValidationSchema=schema1.xsd
TransformationStylesheet=transform1.xslt

[XmlTransform2]
TransformationStylesheet=transform2.xslt
```

In this example, any XML file that matches `schema1.xsd` is transformed by `transform1.xslt`. These files are then parsed. The parameter `ValidationSchema` is not set in the section `XmlTransform2`, so any files that do not match `schema1.xsd` are transformed by `transform2.xslt`.

You can configure as many different transformations as you require. If you set the parameter `ValidationSchema` in every section and an XML file does not match any of the schemas, it is not transformed.

Parse XML into Documents

CFS attempts to parse any XML file that it receives according to rules that are specified in the `[XMLParsing]` section of its configuration file. The parameters in the `[XMLParsing]` section specify:

- How to divide the XML into documents.
- How to populate each document's `DREREFERENCE` field.
- How to populate each document's `DRECONTENT` field.

To configure settings for parsing XML

1. Open the CFS configuration file.
2. In the `[XMLParsing]` section, set the following parameters:

`DocumentRootPaths`	A comma-separated list of paths to nodes that contain a single document. Specify the paths relative to the root of the XML. Use a forward slash (/) to represent levels in the XML hierarchy. Any elements

	contained within the specified node are added to the document as metadata.
`IncludeRootPath`	A Boolean value (default `false`) that specifies whether to include the node specified by `DocumentRootPaths` in the document. You might set this parameter to **`TRUE`** if the root node has attributes that you need to include in the document.
`ReferencePaths`	A comma-separated list of possible paths to a node that contains the document reference. Specify the paths relative to the node identified by `DocumentRootPaths`. Use a forward slash (/) to represent levels in the XML hierarchy. The XML for each document must contain exactly one node that matches the specified path(s).
`ContentPaths`	A comma-separated list of possible paths to a node that contains the document content. Specify the paths relative to the node identified by `DocumentRootPaths`. Use a forward slash (/) to represent levels in the XML hierarchy. If multiple content nodes are identified for a single document, a document is produced with multiple sections.

3. Save and close the configuration file.

Example

Consider the following XML:

```
<xml>
   <documents>
      <document>
         <metadata>
           <name>This is the name of the document</name>
           <created>28/02/15 11:01:17</created>
           <modified>28/02/15 15:23:00</modified>
         </metadata>
         <content>Here is some content</content>
       </document>
       <document>
         <metadata>
           <name>This is another document</name>
           <created>01/03/15 12:21:13</created>
           <modified>02/03/15 13:23:03</modified>
         </metadata>
         <different_content>Here is some content</different_content>
       </document>
     </documents>
 </xml>
```

To ingest this XML file, you might use the following configuration:

```
[XMLParsing]
DocumentRootPaths=documents/document
ReferencePaths=metadata/name
ContentPaths=content,different_content
```

To ingest the XML, send the ingest action to CFS:

```
http://localhost:7000/action=ingest&adds=%3Cadds%3E%3Cadd%3E%3Csource%20
                                         filename%3D%22xmlfile.xml%22%20
                                         lifetime%3D%22permanent%22%20%2F%3E
                                         %3C%2Fadd%3E%3C%2Fadds%3E
```

This would produce the following documents:

```
#DREREFERENCE This is the name of the document
#DREFIELD UUID="bfa1a8aac0b772d1ee467d830fa179bc"
#DREFIELD DocTrackingId="3cd0e5cf3160163adf7445d013ef10b1"
#DREFIELD ImportVersion="1207655"
#DREFIELD KeyviewVersion="10220"
#DREFIELD metadata/created="28/02/15 11:01:17"
#DREFIELD metadata/modified="28/02/15 15:23:00"
#DRECONTENT
Here is some content
#DREENDDOC

#DREREFERENCE This is another document
#DREFIELD UUID="aadf6628fccd0c6b885a79e2e39f4357"
#DREFIELD DocTrackingId="66a63287d85b500159c5b5fb099b99a5"
#DREFIELD ImportVersion="1207655"
#DREFIELD KeyviewVersion="10220"
#DREFIELD metadata/created="01/03/15 12:21:13"
#DREFIELD metadata/modified="02/03/15 13:23:03"
#DRECONTENT
Here is some content
#DREENDDOC
```

Ingest PST Files

Consider the following points before ingesting Microsoft Outlook Personal Folders (PST) files:

- The best results are usually obtained when KeyView uses MAPI to extract and filter PST files. To use MAPI, you must:
  - Run CFS on Windows.
  - Install Microsoft Outlook on the same machine as CFS. If you are using 64-bit CFS, install 64-bit Outlook. If you are using 32-bit CFS, install 32-bit Outlook.

- Ensure that MAPI has write access to the PST files. Set the `WorkingDirectory` parameter in the `[ImportService]` section of the CFS configuration file so that CFS copies files to a working directory and processes the copies, rather than processing the files in their original location.

- PST files can contain a large amount of data and KeyView might not finish processing them within the default time limit allowed by CFS. Consider increasing the value of the `KeyviewTimeout` parameter, in the `[ImportService]` section of the CFS configuration file.

Ingest Password-Protected Files

To process password-protected files you must provide CFS with the passwords.

To specify the passwords for password-protected files

1. Create a credentials file to contain the passwords for your password-protected files:
   a. Open a text editor and create a new text file.
   b. Create an `[ImportService]` section in the file.
   c. In the `ImportService` section, set the following parameter:

`ImportCredentialCount`	The total number of file name and password combinations specified in the credentials file.

   For example:

   ```
   [ImportService]
   ImportCredentialCount=1
   ```

   d. Create a new section in the file, named `[CredentialN]`, where *N* is the number of the file name/password combination, starting from 0.

   In the new section, set the following parameters:

`FileSpec`	The name of the password protected file(s). You can use the `*` wildcard to match the file name(s).
`Password`	The password for the file(s). You can encrypt the password using the password encryption utility. For information about how to do this, see Encrypt Passwords, on page 24.
`UserName`	The user name to use to open the file(s). Set this parameter if a user name is required to access the file.
`NotesIDFile`	The path of the ID file. Set this parameter for `.nsf` files only.

   For example, the following settings could be used to specify a single password for all ZIP files:

```
[ImportService]
ImportCredentialCount=1

[Credential0]
FileSpec=*.zip
Password=9t3M3t7awt/J8A
```

e. To specify further file name and password combinations, repeat steps c and d.

f. Save the file to a suitable location.

2. Specify the location of the credentials file. There are several ways to do this:

   - To use the credentials file you created for all ingested documents, set the CFS configuration parameter `ImportCredentialFile` to the path of the file. For more information about this parameter, refer to the *Connector Framework Server Reference*.
   - To use the credentials file that you created to process a single document, set the document field `AUTN_CREDENTIALS`. This field accepts either the path to the credentials file, or the credentials file content. You can encrypt the text using the password encryption utility. The `AUTN_CREDENTIALS` field is removed from all documents before they are indexed. When you send an `ingest` action to CFS, you can set this field using the `xmlmetadata` element in the `adds` or `updates` action parameter. For more information about the ingest action, refer to the *Connector Framework Server Reference*.

Ingest Data for Testing

To ingest data for testing purposes, use the `IngestTest` action. You can use this action to view the output of the ingestion process for a small amount of data, without the data being indexed into IDOL.

> **TIP:** CFS includes an XSL template to help you send `IngestTest` actions. Open a web browser and navigate to `http://host:7000/action=IngestTest&Template=IngestTest` (where *host* is the machine where CFS is running and `7000` is the CFS ACI port).
>
> Micro Focus does not support the XSL template, it is provided only as an example of a template that you could build.

The `IngestTest` action has the following parameters:

```
/action=IngestTest
            &config=[base64_encoded_config]
            &adds=[URL_encoded_adds_xml]
```

`IngestTest` is similar to the `Ingest` action, but has the following differences which make it suitable for testing:

- `IngestTest` is a synchronous action, and the document data is returned in the ACI response.
- Indexing, whether as a result of ingestion or as a result of an import task, is disabled.
- Update and Delete commands are disabled (you cannot use the `updates` and `removes` action parameters like you can with the `Ingest` action).

- Any writer tasks that have been configured (`IdxWriter`, `XmlWriter`, `JsonWriter`, `CsvWriter`, `SqlWriter`) are disabled.
- Logging to the import log stream is disabled. The log messages are redirected to the action response.
- The global Lua variable `is_test` is set to `true`. You can use this variable in your Lua scripts to prevent certain parts of your scripts from running when you use the `IngestTest` action.

For more information about the `IngestTest` action and its parameters, refer to the *Connector Framework Server Reference*.

Chapter 6: Filter Documents and Extract Subfiles

CFS automatically extracts metadata, content, and sub-files from all files that are ingested. KeyView does not need to be configured, but this section describes how to customize the filtering and extraction process.

Customize KeyView Filtering

If necessary, you can customize the filtering and extraction process. For example, you can choose whether to extract comments added by reviewers to a Microsoft Word document.

To customize filtering, use the Import Service parameters, in the `[ImportService]` section of the CFS configuration file. For information about the parameters that you can set, refer to the *Connector Framework Server Reference*.

You can also customize KeyView filtering by modifying the configuration parameters in the KeyView `filters\formats.ini` configuration file. For more information about customizing KeyView filtering by modifying `formats.ini`, refer to the KeyView documentation.

Disable Filtering or Extraction for Specific Documents

To prevent KeyView from processing specific documents, you can add the following fields to documents. You can add the fields with any value.

AUTN_FILTER_META_ONLY	Prevents CFS extracting content from a file. CFS only extracts metadata and adds this information to the document.
AUTN_NO_FILTER	Prevents CFS extracting any text (metadata or content) from a file. This can be useful if you do not want to extract text from certain file types.
AUTN_NO_EXTRACT	Prevents CFS from extracting sub-files. This can be useful if you want to avoid extracting items from ZIP files and other container files.

> **NOTE:** To add a field to a document, use a Lua script. You must run the Lua script using a *Pre* import task. This is because *Post* import tasks run after KeyView filtering.

Related Topics

- Write and Run Lua Scripts, on page 55
- Add a Field to a Document, on page 62

Chapter 7: Manipulate and Enrich Documents

This section describes how to manipulate and enrich documents using CFS.

Introduction

The documents produced by connectors and CFS contain information extracted from the source repository. In many cases you might want to add additional information to documents, or modify the structure of the documents, before they are indexed.

To modify documents before they are indexed, use *Import Tasks* and *Index Tasks*. These are customizable processing tasks that you can run on documents. You can use these tasks to write documents to disk, manipulate documents, reject documents, and run custom Lua scripts.

Write documents to disk

You can write documents to disk in IDX or XML format. This allows you to view the information that is being indexed, so that you can check the information is being indexed as you expected. If necessary, you can then use other import tasks to manipulate and enrich the information.

Manipulate and enrich documents

You can use import tasks to enrich documents. For example, you can:

- extract the meaningful content from HTML, and discard advertisements, headers, and sidebars.
- divide document content into sections. Dividing a document can result in more relevant query results, because IDOL can return a specific part of a document in response to a query.
- extract speech from audio and video files, and write a transcription of the speech to the document content. IDOL Server can then use the speech for retrieval, clustering, and other operations.

Validate and reject documents

You can reject documents that you do not want to index, for example those that do not appear to contain valid content. When a document is rejected, it is not processed further and is not indexed. However, you can index the document into an IDOL Server that has been configured to handle failed documents.

Run a Lua Script

Lua is an embedded scripting language that you can use to manipulate documents and define custom processing rules. CFS includes Lua functions for manipulating documents and running other tasks.

Choose When to Run a Task

Import Tasks run when new documents are processed by CFS, before the documents are indexed. You can run Import Tasks before and/or after KeyView filtering.

- *Pre*-import tasks run before KeyView filtering. At this point the document only contains metadata extracted from the repository by the connector.
- *Post*-import tasks run after KeyView filtering. At this point the document also contains any content and metadata that was extracted from the file associated with the document.

Index Tasks run when a document's metadata (but not its content) is updated, or when a document is deleted. When a connector detects that document metadata has been updated or that a document has been deleted from a repository, it sends this information to CFS so that the document can be updated or removed from indexes such as IDOL Server.

- *Update* index tasks run when a document's metadata (but not its content) is updated.
- *Delete* index tasks run when a document is deleted from a repository.

You can run some tasks, such as the `Lua` task, at any point during the import or indexing process.

You can run other tasks only at specific points within the import or indexing process. For example, to validate the content of documents you must use a post-import task. You cannot use a pre-import task because pre-import tasks occur before KeyView filtering, when documents do not contain any content.

The following table shows when you can run each type of task.

Task	Import Tasks		Index Tasks	
	Pre	Post	Update	Delete
Run a Lua script				
Lua	✓	✓	✓	✓
Write documents to disk				
CsvWriter	✓	✓	✓	✓
IdxWriter	✓	✓	✓	✓
JsonWriter	✓	✓	✓	✓
SqlWriter	✓	✓	✓	✓
XmlWriter	✓	✓	✓	✓
Manipulate and enrich documents				
Eduction		✓		
EmailAddressNormalisation	✓	✓		
ExtractMetadata	✓			
HtmlExtraction	✓			
ImportFile	✓	✓		
Sectioner		✓		

Task	Import Tasks		Index Tasks	
	Pre	Post	Update	Delete
Standardizer	✓	✓		
TextToDocs	✓			
Validate and reject documents				
BadFilesFilter		✓		
BinaryFileFilter		✓		
ImportErrorFilter		✓		
SymbolicContentFilter		✓		
WordLengthFilter		✓		
Media analysis				
MediaServerAnalysis	✓	✓		
IdolSpeech	✓	✓		

You can also call many of the tasks from a Lua script, which allows more advanced processing. For example, you might want to run a task only on selected documents. For information about the Lua functions that are provided by CFS, refer to the *Connector Framework Server Reference*.

Related Topics

- The Import Process, on page 13.

Create Import and Index Tasks

Import tasks are configured in the `[ImportTasks]` section of the CFS configuration file. Import tasks run when files are imported, for example when a new item is retrieved from a repository or when the content of a file in a repository is updated. Use the `Pre` parameter to specify a list of tasks to run before KeyView filtering, and the `Post` parameter to specify a list of tasks to run after KeyView filtering.

Index tasks are configured in the `[IndexTasks]` section of the CFS configuration file. Use the `Update` parameter to specify a list of tasks to run when a connector instructs CFS to update the metadata of a document. Use the `Delete` parameter to specify a list of tasks to run when a connector instructs CFS to delete a document from indexes such as IDOL Server.

The tasks that you define run in sequence. In the following example, CFS creates an IDX file, then runs a Lua script, and then creates another IDX file:

```
[ImportTasks]
Post0=IdxWriter:C:\IDXArchive\before_script.idx
Post1=Lua:C:\Scripts\my_script.lua
Post2=IdxWriter:C:\IDXArchive\after_script.idx
```

To create an import task

1. Stop CFS.
2. Open the CFS configuration file.
3. Find the `[ImportTasks]` section of the configuration file, or create it if it does not exist.
4. Add the task by setting the `Pre` or `Post` parameter.

   The value of the `Pre` or `Post` parameter must be the name of the task that you want to run. Some tasks also require further information, such as the name of a file or the name of a section in the configuration file.

   For example, to run a Lua script before KeyView filtering:

   ```
   [ImportTasks]
   Pre0=Lua:myscript.lua
   ```

5. Some import tasks require you to identify the documents to process by adding a field to the documents. For example, the `IdolSpeech` task only runs on documents that have the `AUTN_NEEDS_TRANSCRIPTION` field. For more information about the document fields that are used with import tasks, see Document Fields for Import Tasks, on the next page.

   To add a field to the documents that you want to process, use a Lua script. In the following example, a Lua script named `Filter.Lua` runs before an `IdolSpeech` import task, to identify suitable documents and add the field `AUTN_NEEDS_TRANSCRIPTION`.

   ```
   [ImportTasks]
   Pre0=Lua:Filter.lua
   Pre1=IdolSpeech:IdolSpeechSettings
   ```

6. Save the configuration file and restart CFS.

To create an index task

1. Stop CFS.
2. Open the CFS configuration file.
3. Find the `[IndexTasks]` section of the configuration file, or create it if it does not exist.
4. Add the task by setting the `Update` or `Delete` parameter.

   The value of the `Update` or `Delete` parameter must be the name of the task that you want to run. Some tasks also require further information, such as the name of a file or the name of a section in the configuration file.

For example:

```
[IndexTasks]
Update0=Lua:myscript.lua
```

5. Save the configuration file and restart CFS.

Document Fields for Import Tasks

You can customize how documents are processed by import tasks, by adding the following fields to your documents.

NOTE: The Lua script that adds the document fields must run before the import tasks.

AUTN_NEEDS_TRANSCRIPTION

To use an IDOL Speech Server to extract the speech from a document that represents an audio or video file, you must add the field `AUTN_NEEDS_TRANSCRIPTION` to the document. The `IdolSpeech` task only runs on documents that have this field. The field can have any value. For more information about the `IdolSpeech` task, see Analyze Speech, on page 72.

AUTN_FORMAT_CORRECT_FOR_TRANSCRIPTION

To bypass the transcoding step of an `IdolSpeech` task, add the field `AUTN_FORMAT_CORRECT_FOR_TRANSCRIPTION`. The field can have any value. Documents that have this field are not sent to a Transcode Server. For more information about the `IdolSpeech` task, see Analyze Speech, on page 72.

AUTN_AUDIO_LANGUAGE

To bypass the language identification step of an `IdolSpeech` task add the field `AUTN_AUDIO_LANGUAGE`. The value of the field must be the name of the IDOL Speech Server language pack to use for extracting speech. Documents that have this field are not sent to the IDOL Speech Server for language identification. For more information about the `IdolSpeech` task, see Analyze Speech, on page 72.

AUTN_NEEDS_MEDIA_SERVER_ANALYSIS

To perform analysis on media files using the `MediaServerAnalysis` task, you must add this field to every document that you want to analyze. The field can have any value.

Write and Run Lua Scripts

Connector Framework Server supports Lua, an embedded scripting language. CFS supports all standard Lua functions. For more information about Lua, refer to http://www.lua.org/.

You can use a Lua script to:

- Add or modify document fields.
- Run built-in processing tasks, such as Eduction or image analysis.
- Call out to an external service, for example to alert a user.
- Interface with other libraries.

Write a Lua Script

Your Lua script must have the following structure:

```
function handler(document)
   ...
end
```

The `handler` function is called for each document and is passed a document object. The document object is an internal representation of the document being processed. Modifying this object changes the document.

For CFS to continue processing the document, the function must return **`true`**. If the function returns **`false`**, the document is discarded.

The script can also terminate due to an error, for example if you use the Lua `error` function or call a Lua function that causes an error. In this case CFS continues to process the document, but places an error message in the `ImportErrorDescription` field.

> **TIP:** You can write a library of useful functions to share between multiple scripts, which you can then include in the scripts by adding **`dofile("library.lua")`** to the top of the lua script outside of the `handler` function.

Run a Lua Script

To run a Lua script, create a `Lua` import or index task, and specify the path to your script. You can run Lua scripts using *pre* and *post* Import Tasks, and using *update* and *delete* index tasks. For example:

```
[ImportTasks]
Post0=Lua:c:\scripts\script1.lua
```

Debug a Lua Script

When you run a Lua script and the script fails due to an error, CFS writes the error to the import log stream, and to the `ImportErrorDescription` field of any documents that are affected.

To debug your Lua scripts, you can use the `LuaDebug` action. You can use this action to pause and resume scripts, and set and remove breakpoints. When a script is paused you can view the values of variables, view a stack trace, and step over single lines.

Sessions

CFS can have more than one import thread, and might run multiple Lua scripts concurrently. This means that you can have multiple Lua Debugging sessions. You might want to pause or continue running scripts on one thread but not others. Some of the commands available through the `LuaDebug` action allow or require you to specify a `session` action parameter. If the `session` parameter is optional and you do not specify a session, the command applies to all sessions. To view open sessions and obtain the values you can set for the `session` action parameter, use the command `/action=LuaDebug&command=get-status`.

Example

The following procedure demonstrates how to set a breakpoint in a script, view the values of Lua variables when the script is paused, and step over single lines. The actions in this procedure assume that your CFS is running on the local machine and is listening for actions on port 7000. For more information about the `LuaDebug` action, refer to the *Connector Framework Server Reference*.

To debug a Lua script

1. In the CFS configuration file, configure the script to run. This example uses the `AddLanguageDetectionFields` script that is included with CFS. For example:

   ```
   [ImportTasks]
   Post0=Lua:scripts/AddLanguageDetectionFields.lua
   ```

2. Start CFS.

3. To pause the script before a specific line is executed, set a breakpoint on that line. Line 33 of the `AddLanguageDetectionFields` script sends an action to IDOL Server and stores the response in a variable named `response`. To stop the script before this happens, use the following action:

   ```
   http://localhost:7000/action=luadebug
                            &command=set-breakpoint
                            &file=scripts/AddLanguageDetectionFields.lua
                            &line=33
   ```

4. (Optional) Confirm the breakpoint has been set using the `get-breakpoints` command:

   ```
   http://localhost:7000/action=luadebug&command=get-breakpoints
   ```

   CFS returns the response.

   ```
   <autnresponse xmlns:autn="http://schemas.autonomy.com/aci/">
      <action>LUADEBUG</action>
      <response>SUCCESS</response>
      <responsedata>
         <data>
            <command>get-breakpoints</command>
            <breakpoints>
               <breakpoint
   ```

```
source="C:\Autonomy\ConnectorFramework\scripts\AddLanguageDetectionFields.lua"
line="33"/>
         </breakpoints>
      </data>
   </responsedata>
</autnresponse>
```

5. Send CFS an `IngestTest` action so that CFS ingests a document and runs the script:

   ```
   http://localhost:7000/action=IngestTest&adds=...
   ```

   > **TIP:** Use an `IngestTest` action, rather than an `Ingest` action, because the `IngestTest` action does not index any information into IDOL Server. For more information about the `IngestTest` action, see Ingest Data for Testing, on page 46.

   CFS runs the script. The `IngestTest` action does not finish (because the script is paused at the breakpoint) and therefore does not return a response.

6. Retrieve a token for the debugging session by sending CFS the `LuaDebug` command `get-status`:

   ```
   http://localhost:7000/action=LuaDebug&command=get-status
   ```

   CFS returns the response. You can see that there is a single debugging session and the Lua script has stopped at the breakpoint.

   ```
   <autnresponse xmlns:autn="http://schemas.autonomy.com/aci/">
      <action>LUADEBUG</action>
      <response>SUCCESS</response>
      <responsedata>
         <data>
            <command>get-status</command>
            <session id="e4f7c45f561930cd17a5aed0fe1481d8">
               <status>AtBreak</status>
            </session>
         </data>
      </responsedata>
   </autnresponse>
   ```

7. To retrieve the values of the Lua variables at the breakpoint, run the `LuaDebug` command `get-locals`. Use the session token that you retrieved with the `get-status` command:

   ```
   http://localhost:7000/action=LuaDebug
                              &command=get-locals
                              &session=e4f7c45f561930cd17a5aed0fe1481d8
   ```

   CFS returns the response.

   ```
   <autnresponse xmlns:autn="http://schemas.autonomy.com/aci/">
     <action>LUADEBUG</action>
     <response>SUCCESS</response>
     <responsedata>
       <data>
   ```

```
      <command>get-locals</command>
      <session id="e4f7c45f561930cd17a5aed0fe1481d8">
        <locals>
          ...
          <local name="idolHost" type="string">localhost</local>
          <local name="idolACIPort" type="number">9000</local>
          <local name="timeout" type="number">30000</local>
          ...
          ...
          <local type="string" name="detectionString">This is a document that
               contains text in English. Automatic Language Detection will
               detect the language and add the information to the document
          ...</local>
        </locals>
      </session>
    </data>
  </responsedata>
</autnresponse>
```

8. Use the `step` command to run line 33. CFS does not run subsequent lines (the script will remain paused). Use the session token you retrieved with the `get-status` command:

   ```
   http://localhost:7000/action=LuaDebug
                            &command=step
                            &session=e4f7c45f561930cd17a5aed0fe1481d8
   ```

   CFS returns the response.

   ```
   <autnresponse xmlns:autn="http://schemas.autonomy.com/aci/">
     <action>LUADEBUG</action>
     <response>SUCCESS</response>
     <responsedata>
       <data>
         <command>step</command>
         <session id="e4f7c45f561930cd17a5aed0fe1481d8"/>
       </data>
     </responsedata>
   </autnresponse>
   ```

9. To see what effect the step had on the variables, run the `get-locals` command again. You should see a new variable named `response` that contains the response from the `DetectLanguage` action.

   ```
   http://localhost:7000/action=LuaDebug
                            &command=get-locals
                            &session=e4f7c45f561930cd17a5aed0fe1481d8
   ```

10. After examining the variables, you might want to remove the breakpoint. To remove the breakpoint, send CFS the following action:

```
http://localhost:7000/action=LuaDebug
                            &command=remove-breakpoint
                            &file=scripts/AddLanguageDetectionFields.lua
                            &line=33
```

CFS returns the response. You can also use `/action=LuaDebug&command=get-breakpoints` to confirm that the breakpoint has been removed.

11. To continue running the Lua script, use the `continue` command:

```
http://localhost:7000/action=LuaDebug
                            &command=continue
                            &session=e4f7c45f561930cd17a5aed0fe1481d8
```

CFS continues to run the script. The `IngestTest` action finishes and returns a response.

Lua Scripts Included With CFS

The CFS installation directory includes a `scripts` folder that includes the following Lua scripts:

Script	Description
`AddLanguageDetectionFields.lua`	Detects the language of a document's content, using the IDOL Server action `DetectLanguage`. The script then adds fields describing the language and encoding to the document's metadata. The script demonstrates how to: • send an action to an ACI server. • parse the action response to a `LuaXmlDocument`. • use the methods of `LuaXmlDocument` to extract data from the document. The script assumes that an IDOL Server is installed on the local machine with an ACI port of 9000. You might need to modify these values. If you use this script, run it as a *post* import task so that it runs after KeyView has extracted document content.
`CategorySuggestFromText.lua`	Sends a document to IDOL for categorization, and adds information about the matching categories to the document's metadata. For information about how to use this script, see Categorize Documents, on page 76.
`filterdodgyfiles.lua`	An example script that demonstrates various ways to reject unwanted files, for example by file extension, by detecting the file format, or by analyzing the file content.
`identifiers.lua`	Adds sub-file indexes to the `AUTN_IDENTIFIER` document

Script	Description
	field of sub-files. This allows a connector to retrieve the sub-file, rather than the whole container, when the `collect` or `view` actions are used to retrieve the original file. If you use this script, you must run it as a *post* import task (so that it runs after KeyView processes the documents). For more information about the `AUTN_IDENTIFIER` field, see AUTN_IDENTIFIER, on page 206.
`IdolSpeech.lua`	Runs speech-to text on all files identified by KeyView as containing audio or video. To use this script, you must configure the settings for your IDOL Speech Server in the `[IdolSpeechSettings]` section of the CFS configuration file. For more information about using this script, see Run Analysis on All Audio and Video Files, on page 72.
`mediaserver/*.lua`	These scripts run analysis on images, audio files, and video files by sending them to Media Server. For information about configuring media analysis, see Analyze Media, on page 65.

NOTE: CFS also includes scripts for use with Eduction. Some of these scripts are Eduction post processing scripts, which modify the output from an Eduction import task. The post processing scripts have the entry point `function processmatch (edkmatch)`, rather than `function handler (document)`. You must run a post processing script using the Eduction import task. Do not run an Eduction post processing script using a Lua task. For more information about Eduction Lua Post Processing, see Lua Post Processing, on page 81. For information about the Eduction scripts that are included with CFS, refer to the *Eduction User Guide.*

Use Named Parameters

Some Lua functions have an argument that takes named parameters. This argument is a table in which you can specify values for various parameters that affect the operation of the function.

You can specify a value for every parameter, or just those that you need. If you do not specify a value for a parameter, the function uses a default value. You can also specify the name of a configuration section and the function will read settings from that section in the CFS configuration file.

For example, when you call the function `looks_like_language`, you can set only the `term_file` named parameter, and use default values for the other settings:

```
looks_like_language(document, { term_file = "english.ocr" })
```

You might choose to set the `stop_list` parameter as well:

```
looks_like_language(document, { term_file = "english.ocr",
                      stop_list = "englishstoplist.dat" })
```

Alternatively, you can specify the name of a section in the CFS configuration file:

```
looks_like_language(document, { term_file = "english.ocr",
                        section = "LanguageSettings" })
```

In this example, the function uses the `english.ocr` term file. The settings for the remaining parameters are read from the `LanguageSettings` section of the CFS configuration file.

If you specify the name of a configuration section and use named parameters, the named parameters override any values set in the configuration file. In the following example, the `threshold` is set to 100, while other parameters (like `term_file`) are read from the `LanguageSettings` section:

```
looks_like_language(document, { section = "LanguageSettings",
                        threshold=100 })
```

For information about individual named parameters and corresponding configuration parameters, refer to the *Connector Framework Server Reference*.

Enable or Disable Lua Scripts During Testing

Lua scripts run by CFS can read a global Lua variable, `is_test`.

- When a script runs as part of an `Ingest` action, this variable is `false`.
- When a script runs as part of an `IngestTest` action, this variable is `true`.

You can use the `is_test` variable to enable or disable parts of a script. For example:

```
if is_test then
   -- The part of the script to enable for IngestTest
   -- (or disable for Ingest)
end

if not is_test then
   -- The part of the script to disable for IngestTest
   -- (or enable for Ingest)
end
```

Example Lua Scripts

This section contains example Lua scripts.

Add a Field to a Document

The following script demonstrates how to add a field named “MyField” to a document, with a value of “MyValue”.

```
function handler(document)
   document:addField("MyField", "MyValue");
   return true;
end
```

The following script demonstrates how to add the field `AUTN_NEEDS_IMAGE_SERVER_ANALYSIS` to all JPEG, TIFF and BMP documents. This field specifies that the documents can be processed using an `ImageServerAnalysis` import task (you must also define the task in the CFS configuration file).

The script finds the file type using the `DREREFERENCE` document field, so this field must contain the file extension for the script to work correctly.

```
function handler(document)
   local extensions_for_ocr = { jpg = 1 , tif = 1, bmp = 1 };
   local filename = document:getFieldValue("DREREFERENCE");
   local extension, extension_found =
      filename:gsub("^.*%.(%w+)$", "%1", 1);

   if extension_found > 0 then
      if extensions_for_ocr[extension:lower()] ~= nil then
         document:addField("AUTN_NEEDS_IMAGE_SERVER_ANALYSIS", "");
      end
   end

   return true;
end
```

Count Sections

For each document, this Lua script adds a total sections count to the title, and replaces the content of each section with the section number.

```
function handler(document)
   local section_count = 0;
   local section = document;

   while section do
      section_count = section_count + 1;
      section:setContent("Section "..section_count);
      section = section:getNextSection();
   end

   local title = document:getFieldValue("TITLE");

   if title == nil then title = "" end
   document:setFieldValue("TITLE", title .." Total Sections "
      ..section_count);

   return true;
end
```

Merge Document Fields

This script demonstrates how to merge the values of document fields.

When you extract data from a repository, CFS can produce documents that have multiple values for a single field, for example:

```
#DREFIELD ATTACHMENT="attachment.txt"
#DREFIELD ATTACHMENT="image.jpg"
#DREFIELD ATTACHMENT="document.pdf"
```

This script shows how to merge the values of these fields, so that the values are contained in a single field, for example:

```
#DREFIELD ATTACHMENTS="attachment.txt, image.jpg, document.pdf"
```

Example Script

```
function handler(document)
   onefield(document,"ATTACHMENT","ATTACHMENTS")
   return true;
end

function onefield(document,existingfield,newfield)
   if document:hasField(existingfield) then
      local values = { document:getFieldValues(existingfield) }
      local newfieldvalue=""

      for i,v in ipairs(values) do
         if i>1 then
            newfieldvalue = newfieldvalue ..", "
         end

         newfieldvalue = newfieldvalue..v
      end

      document:addField(newfield,newfieldvalue)
   end

   return true;
end
```

Add Titles to Documents

IDOL documents have a field named DRETITLE that can contain a title for the document. Front end applications might use the value of this field to present a title to users when displaying query results.

You should not rely on a connector to add a document title, because the connector might not be able to obtain this information. A suitable title for an e-mail message could be the subject of the e-mail, but this is not extracted until the e-mail is processed by CFS.

You can therefore use a Lua script to add a title to documents that do not have one, and, if necessary, ensure that all documents have suitable titles.

CFS includes a Lua script that adds titles to documents. The script is named `ExtractDreTitles.lua`, and is located in the `scripts` folder, in the CFS installation directory. You can use this script or modify it to suit your requirements.

The unmodified script ensures that all documents have a title. If a title has already been added to the document, that title is respected. If the document does not have a title, the script attempts to extract one from metadata fields that are added by KeyView and often contain titles. If none of these fields are present, the script adds a title by extracting the original file name from the field `DREORIGINALNAME`.

To add titles to documents using the `ExtractDreTitles` Lua script

1. Open the CFS configuration file.
2. Find the `[ImportTasks]` section of the configuration file, or create this section if it does not exist.
3. In the `[ImportTasks]` section, configure a `Post` import task to run the Lua script `scripts/ExtractDreTitles.Lua`.

   For example:

   ```
   [ImportTasks]
   Post0=Lua:scripts/ExtractDreTitles.lua
   ```

   > **TIP:** You must use a `Post` task so that the script runs after KeyView filtering.

4. Save and close the configuration file.

Analyze Media

Images, audio, and video are examples of unstructured information that represent a vast quantity of data. CFS extracts metadata from these files but cannot process their content, so by default documents that represent these files are indexed without any content.

To enrich documents that represent rich media files, you can send the files to an IDOL Media Server for analysis. Media Server can:

- extract text from scanned documents, and subtitles and scrolling text from video.
- identify people that appear by matching faces to a database of known faces.
- identify known logos and objects.
- detect and read barcodes, including QR codes.
- determine the language of speech in a video file, convert the speech into text, and identify any known speakers (speech processing also requires an IDOL Speech Server).

For more information about the types of analysis that you can run, refer to the *Media Server Administration Guide*.

> **NOTE:** Some types of analysis require you to train Media Server before you start processing.

Create a Media Server Configuration

To run analysis on media, you must create a Media Server configuration file that instructs Media Server how to process the media. Micro Focus recommends that you save the configuration in a location accessible to CFS, and configure CFS to send the configuration to Media Server with each request.

Example Media Server configurations are provided with CFS in the `script_resources/mediaserver` directory.

The Media Server configuration must meet the following requirements.

Ingestion

There is no single configuration that can process both images and video, so you must configure Media Server to ingest the correct type of media.

The following example demonstrates how to configure ingestion. To process audio or video files, set the parameter `IngestEngine=AudioVideo` so that Media Server uses the settings in the `[AudioVideo]` section of the configuration. To process image files (including PDF files and office documents that contain embedded images), set the parameter `IngestEngine=Image`. The Lua functions `analyze_media_in_document` and `analyze_media_in_file` allow you to override individual parameters, so if you request analysis from a Lua script you can first determine the file type and then set the value of the parameter when you call the function.

```
[Ingest]
IngestRate=0
IngestEngine=AudioVideo

[AudioVideo]
Type=LibAv

[Image]
Type=Image
```

For more information about configuring ingestion, and the file types that are supported, refer to the *Media Server Administration Guide*.

Analysis

Create a section in the configuration file named `[Analysis]`, and configure the analysis operations that you want to run.

The following example configures face detection and optical character recognition:

```
[Analysis]
AnalysisEngine0=FaceDetect
AnalysisEngine1=OCR

[FaceDetect]
Type=FaceDetect
```

```
MinSize=70

[OCR]
Type=OCR
```

For more information about configuring analysis in Media Server, refer to the *Media Server Administration Guide*.

Output

CFS expects Media Server to return the results of analysis in the `process` action response. You must create a section in the configuration file named `[Output]`, and configure an output task to write data to the action response.

```
[Output]
OutputEngine0=response

[response]
Type=response
```

Configure the Media Analysis Task

You can run media analysis on documents by using the `MediaServerAnalysis` import task. This task only processes documents that have the document field `AUTN_NEEDS_MEDIA_SERVER_ANALYSIS`, so you must add this field to any document that you want to process.

To configure the Media Server Analysis task

1. Write a Lua script to add the document field `AUTN_NEEDS_MEDIA_SERVER_ANALYSIS` to the documents that you want to analyze. For an example script that adds a field to a document, see Add a Field to a Document, on page 62.
2. Open the CFS configuration file.
3. In the `[ImportTasks]` section, configure a `Pre` or `Post` import task to run your Lua script. For example:

   ```
   [ImportTasks]
   Pre0=Lua:scripts/TagVideoFiles.lua
   ```
4. Add another `Pre` or `Post` task to run the `MediaServerAnalysis` task. Set the `Pre` or `Post` parameter to `MediaServerAnalysis`, followed by a colon (`:`), followed by the name of the section in the CFS configuration file that contains the task settings. For example:

   ```
   Pre1=MediaServerAnalysis:MediaServerSettings
   ```
5. Create a new section in the configuration file, using the name you specified in Step 4.
6. In the new section, set the following parameters:

`MediaServerHost`	The host name and ACI port of your Media Server. To distribute requests between several servers, specify a comma-separated list of servers.
`MediaAnalysisTransform`	(Optional) To transform the metadata produced by Media Server, before CFS adds the data to your documents, set this parameter to the path of the XSL transformation to use. By default, CFS adds the information to your documents in a document field named `MediaServerAnalysis`, in the same structure that is returned from Media Server.

7. Specify the Media Server configuration file that you want to use for running analysis:
   - If you saved your configuration file in the directory specified by the `ConfigDirectory` parameter, in the `[Paths]` section of the Media Server configuration file, set `MediaServerConfigurationName` to the name of the configuration.
   - If you saved your configuration file in a location accessible by CFS, set the parameter `MediaServerConfigurationFileName` to the path of the configuration file. If you set a relative path, specify the path relative to CFS, not relative to Media Server.
8. Specify how to send media to Media Server:
   - If your Media Server can read files directly from the CFS working directory, set `ReadFromOriginalLocation=TRUE`.
   - To copy files to a shared folder, set the configuration parameter `MediaServerSharedPath`. This folder must be accessible to both CFS and Media Server. CFS copies files to the shared folder so that Media Server can read them. Micro Focus recommends that you use a shared folder for sending large files.
   - To send files to Media Server using HTTP POST requests, set neither `ReadFromOriginalLocation` nor `MediaServerSharedPath`.
9. Save and close the configuration file.

Examples

The following example shows how to configure the `MediaServerAnalysis` task. This example runs analysis using a configuration named `RecognizeFacesInVideo` that exists on the Media Server machine:

```
[ImportTasks]
Pre0=Lua:TagVideoFiles.lua
Pre1=MediaServerAnalysis:MediaServerSettings

[MediaServerSettings]
MediaServerHost=localhost:14000
MediaServerConfigurationName=RecognizeFacesInVideo
ReadFromOriginalLocation=TRUE
```

The following example is similar but configures CFS to send a configuration file to Media Server:

```
[ImportTasks]
Pre0=Lua:TagVideoFiles.lua
Pre1=MediaServerAnalysis:MediaServerSettings

[MediaServerSettings]
MediaServerHost=localhost:14000
MediaServerConfigurationFileName=./script_resources/mediaserver/facerecognition.cfg
ReadFromOriginalLocation=TRUE
```

If your CFS and Media Server are running on separate machines, you can configure CFS to copy media files to a shared folder:

```
[ImportTasks]
Pre0=Lua:TagVideoFiles.lua
Pre1=MediaServerAnalysis:MediaServerSettings

[MediaServerSettings]
MediaServerHost=media1:14000,media2:14000
MediaServerConfigurationName=RecognizeFacesInVideo
MediaServerSharedPath=\\server\videofiles
```

CFS adds the results of analysis to your documents. By default, the information is added in the same structure that is returned from Media Server, in a document field named `MediaServerAnalysis`. Using the configuration parameter `MediaAnalysisTransform`, you can configure CFS to run an XSL transformation to transform the information before adding it a document:

```
[ImportTasks]
Pre0=Lua:TagVideoFiles.lua
Pre1=MediaServerAnalysis:MediaServerSettings

[MediaServerSettings]
MediaServerHost=media1:14000,media2:14000
MediaServerConfigurationName=RecognizeFacesInVideo
MediaServerSharedPath=\\server\videofiles
MediaAnalysisTransform=./xslt/transform.xsl
```

For more information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Run Analysis From Lua

CFS provides Lua functions to run media analysis from a Lua script. These functions are named `analyze_media_in_document` and `analyze_media_in_file`. There are several advantages to running media analysis from a Lua script, instead of using the `MediaServerAnalysis` import task.

Firstly, you can use a single configuration to process audio, video, and image files. Your Lua script can identify the type of content that is associated with a document, and choose the correct Media Server engine to use for ingesting that content. The only way to process audio, video, and image files using the `MediaServerAnalysis` import task is to configure several tasks.

Secondly, you can configure more complex operations. For example, you can write a Lua script that sends audio to Media Server for language identification, and then uses the results of language identification to run speech-to-text with the correct language pack.

Finally, you can run analysis from Lua by configuring a single import task. To use the `MediaServerAnalysis` import task, you run a Lua script that identifies the documents to process, followed by the `MediaServerAnalysis` task itself.

CFS is supplied with example scripts that run media analysis. The scripts are in the `scripts/mediaserver` folder, in the CFS installation directory.

The following procedure demonstrates how to configure media analysis from a Lua script, in this case language detection followed by speech-to-text.

To run media analysis from Lua

1. Write a Lua script that identifies the documents that you want to process and calls the function `analyze_media_in_document` (or `analyze_media_in_file`).

   An example Lua script for running language detection and speech-to-text is located at `./scripts/mediaserver/LangDetectAndSpeechToText.lua`.

2. Create one or more configurations for Media Server that specify the tasks to perform. The Lua script `LangDetectAndSpeechToText.lua` uses two configurations, one for language detection and another for speech-to-text:

   - `./script_resources/mediaserver/langdetect.cfg`
   - `./script_resources/mediaserver/speechtotext.cfg`

   If you are using the example configuration files, check that the details are correct for your environment. For example, you might need to set the host name and ACI port of your Speech Server.

3. In the CFS configuration file, create an import task to run the Lua script. For example:

   ```
   [ImportTasks]
   Pre0=Lua:./scripts/mediaserver/LangDetectAndSpeechToText.lua

   [MediaServerSettings]
   MediaServerHost=mediaserver:14000
   ReadFromOriginalLocation=true
   // MediaServerSharedPath=<Share Directory UNC path>
   ```

   The example script passes the `[MediaServerSettings]` section to the Lua function `analyze_media_in_document`. In the example configuration, above, this section provides the host name and ACI port of the Media Server and specifies how Media Server can access the media.

   You can provide files to Media Server in several ways:

   - If your Media Server can read files directly from the CFS working directory, set `ReadFromOriginalLocation=TRUE`.
   - To copy files to a shared folder, set the configuration parameter `MediaServerSharedPath`. This folder must be accessible to both CFS and Media Server. CFS copies files to the shared

folder so that Media Server can read them. Micro Focus recommends that you use a shared folder for sending large files.

- To send files to Media Server using HTTP POST requests, set neither `ReadFromOriginalLocation` nor `MediaServerSharedPath`.

4. Save and close the configuration file.

Examples

The following example configuration runs OCR on all supported image and video files ingested by CFS:

```
[ImportTasks]
Pre0=Lua:scripts/mediaserver/OCR.lua

[MediaServerSettings]
MediaServerHost=localhost:14000
ReadFromOriginalLocation=TRUE
```

If your CFS and Media Server are running on separate machines, you can configure CFS to copy the files to a shared folder:

```
[ImportTasks]
Pre0=Lua:scripts/mediaserver/OCR.lua

[MediaServerSettings]
MediaServerHost=mediaserver:14000
MediaServerSharedPath=\\server\videofiles
```

Troubleshoot Media Analysis

This section describes how to troubleshoot problems that might occur when you configure media analysis.

Error: Failed to find output node in response

```
Task (type: POST) failed with error: MediaServerAnalysis task failed: Failed to find output node in response
```

Analysis will fail if CFS cannot retrieve the results of analysis from Media Server. If your analysis task fails with this error, check that your Media Server configuration includes an output task to add the results of analysis to the `process` action response. For example:

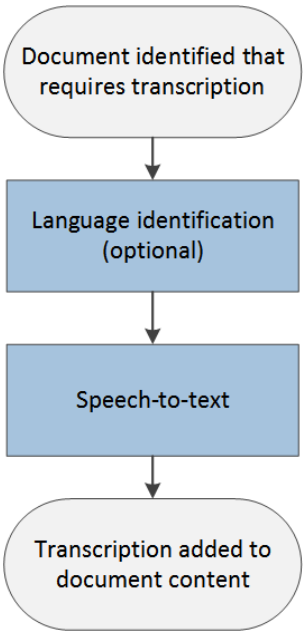
```
[Output]
OutputEngine0=response

[response]
Type=response
```

Analyze Speech

CFS extracts metadata from audio and video files but cannot process their content, so by default documents that represent audio and video are indexed without any content. You can enrich these documents by sending the files to an IDOL Speech Server. The Speech Server processes the audio, extracts any speech, and writes it to the document content.

The processing task that sends files to IDOL Speech Server for analysis is called `IdolSpeech`. It can include the following steps.



1. Documents are identified that require speech-to-text processing.
2. (Optional) CFS sends the audio to an IDOL Speech Server to determine the language of the speech.
3. CFS sends the audio to an IDOL Speech Server for transcription.
4. CFS adds the transcription to the document content.

Run Analysis on All Audio and Video Files

To run speech-to-text on all files identified by KeyView as containing audio or video, run the Lua script `scripts/IdolSpeech.Lua`. The script reads settings from the `[IdolSpeechSettings]` section of the CFS configuration file.

The following example demonstrates how to run the script and specify information about your Speech Server:

```
[ImportTasks]
Pre0=Lua:scripts/IdolSpeech.lua
```

```
[IdolSpeechSettings]
IdolSpeechServers=server:15000
IdolSpeechLanguage=ENUK
```

The `IdolSpeechServers` parameter specifies the host name or IP address, and ACI port, of your Speech Server. Speech-to-text processing can be time consuming, so you can distribute the load over more than one Speech Server. For information about how to do this, see Use Multiple Speech Servers, on the next page.

The `IdolSpeechLanguage` parameter is optional and specifies the language pack to use for transcription. If you do not set this parameter, Speech Server runs language detection on each file and chooses a language pack automatically. If you know that all of your files are in the same language, Micro Focus recommends setting this parameter to reduce the load on the Speech Server.

If you prefer to send files to your IDOL Speech Server by writing them to a shared folder, add the `IdolSpechUseSharedPath` and `SharedPath` parameters to the configuration:

```
[ImportTasks]
Pre0=Lua:scripts/IdolSpeech.lua

[IdolSpeechSettings]
IdolSpeechServers=server:15000
IdolSpeechLanguage=ENUK
IdolSpeechUseSharedPath=true
SharedPath=\\server\SharedPath
```

Setting the parameter `IdolSpeechUseSharedPath` to `true` specifies that CFS sends files to Speech Server by copying them to a shared folder. The `SharedPath` parameter specifies the location of the shared folder. The folder must be accessible to both CFS and Speech Server.

Run Analysis on Specific Documents

To run speech-to-text on specific documents, you can modify the criteria in `scripts/IdolSpeech.lua`, or you can use the `IdolSpeech` import task and write your own Lua script to identify the documents to process. The `IdolSpeech` task only processes documents that have the field `AUTN_NEEDS_TRANSCRIPTION`, so your script must add this field to any document that you want to process.

The following example shows how to configure the `IdolSpeech` task in the CFS configuration file:

```
[ImportTasks]
Pre0=Lua:Identify_Audio_Files.lua
Pre1=IdolSpeech:IdolSpeechSettings

[IdolSpeechSettings]
IdolSpeechServers=server:15000
IdolSpeechLanguage=ENUK
```

The `Pre0` import task runs a Lua script that determines whether a file is suitable for transcription. You must write this script. The script must add the field `AUTN_NEEDS_TRANSCRIPTION` to any documents that you want to process. You can include conditions in the script to filter documents based on the document source, file type, or metadata extracted by KeyView.

The `Pre1` import task is the `IdolSpeech` task. It specifies the name of a section in the configuration file that contains the settings for the task. In this example the section is named `IdolSpeechSettings`.

The `IdolSpeechServers` parameter specifies the host name or IP address, and ACI port, of your IDOL Speech Server. To use multiple Speech Servers, see Use Multiple Speech Servers, below.

The `IdolSpeechLanguage` parameter is optional and specifies the language pack to use for transcription. You can set this parameter when all of your audio files are in the same language. If your audio files are in different languages, remove `IdolSpeechLanguage` so that Speech Server uses language detection to detect the language for each document. For more information about language identification, see Language Identification, below.

If you prefer to send files to your IDOL Speech Server by writing them to a shared folder, add the `IdolSpeechUseSharedPath` and `SharedPath` parameters to the configuration:

```
[ImportTasks]
Pre0=Lua:Identify_Audio_Files.lua
Pre1=IdolSpeech:IdolSpeechSettings

[IdolSpeechSettings]
IdolSpeechServers=server:15000
IdolSpeechLanguage=ENUK
IdolSpeechUseSharedPath=true
SharedPath=\\server\SharedPath
```

Setting `IdolSpeechUseSharedPath=TRUE` instructs CFS to send files to Speech Server by writing them to the shared folder. specified by the `SharedPath` parameter.

For more information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Use Multiple Speech Servers

Language identification and speech-to-text processing can be time consuming. To increase performance, you can use several IDOL Speech Servers. The `IdolSpeechServers` configuration parameter accepts a comma-separated list of servers. For example:

```
IdolSpeechServers=server1:15000,server2:15000
```

Alternatively, you can use a numbered list:

```
IdolSpeechServers0=server1:15000
IdolSpeechServers1=server2:15000
```

Language Identification

To convert speech to text successfully, the IDOL Speech Server must know the language of the speech.

The IDOL Speech Server can automatically identify the language of speech. If language identification is not bypassed using one of the following methods it is performed automatically.

To bypass language identification

- To bypass language identification for all documents, set the `IdolSpeechLanguage` configuration parameter. This parameter specifies the language pack to use for all documents and takes precedence over other language settings. You can set this parameter when all of your audio is in the same language.
- To bypass language identification for a single document, add the field `AUTN_AUDIO_LANGUAGE` to the document. The value of the field must identify the language pack to use for transcription, for example:

  ```
  #DREFIELD AUTN_AUDIO_LANGUAGE="ENUK"
  ```

For a list of IDOL Speech Server language packs, refer to the *IDOL Speech Server Administration Guide*.

Transcode Audio

In most cases you do not need to transcode audio before sending it to IDOL Speech Server.

> **TIP:** Transcoding is necessary only when you set `IdolSpeechUseStreaming=TRUE`, which is **not** recommended.

In the following configuration, audio is streamed to the IDOL Speech Server, because the parameter `IdolSpeechUseStreaming` is `TRUE`. The configuration therefore includes the parameters `TranscodeServerHost` and `TranscodeServerPort` so that CFS sends the audio to a Transcode Server before it is sent to Speech Server. Although the audio is streamed to Speech Server, the shared folder specified by the `SharedPath` parameter is required so that CFS and the Transcode Server can exchange data.

```
[ImportTasks]
Pre0=Lua:scripts/IdolSpeech.lua

[IdolSpeechSettings]
IdolSpeechServers=server1:15000,server2:15000
IdolSpeechUseStreaming=TRUE
TranscodeServerHost=server3
TranscodeServerPort=30000
SharedPath=\\server\SharedPath
IdolSpeechLanguage=ENUK
```

If you are streaming audio to Speech Server but know that files are already in an acceptable format, you can configure CFS to bypass the transcoding step of the `IdolSpeech` task.

To bypass transcoding

- To bypass transcoding for all documents, do *not* set the `TranscodeServerHost` or `TranscodeServerPort` configuration parameters when you configure the `IdolSpeech` task.

- To bypass transcoding for a single document, add the field AUTN_FORMAT_CORRECT_FOR_TRANSCRIPTION to the document. The field can have any value. CFS does not send these files to the Transcode Server.

Speech-To-Text Results

When you run speech-to-text, CFS adds a transcription of the speech to the document content (the DRECONTENT field).

CFS can also add the start time, duration, and confidence score for each detected word, sentence boundary, and period of silence to the document metadata:

- To add start times and durations to the document metadata, set the parameter AddTimingsToMetadata=TRUE.
- To add confidence scores to the document metadata, set the parameter AddConfidenceToMetadata=TRUE.

If you choose to add information to the document metadata, CFS adds a metadata field named SpeechToTextWord for each detected word, sentence boundary, or period of silence.

When you set AddTimingsToMetadata=TRUE, the field includes attributes named start and duration, which describe the start time and duration in the audio:

```
<SpeechToTextWord start="3.1562" duration="0.3568">hello</SpeechToTextWord>
```

When you set AddConfidenceToMetadata=TRUE, the field includes an attribute named confidence, which describes the confidence score. The confidence score is a value between 0 (zero) and 1. Higher confidence scores indicate greater confidence of a correct result.

```
<SpeechToTextWord confidence="0.9568">hello</SpeechToTextWord>
```

When you set AddTimingsToMetadata=TRUE and AddConfidenceToMetadata=TRUE, CFS adds fields that include all of these attributes:

```
<SpeechToTextWord start="3.1562" duration="0.3568"
confidence="0.9568">hello</SpeechToTextWord>
```

Fields that represent periods of silence have no value, for example:

```
<SpeechToTextWord start="3.1562" duration="0.3568" confidence="0.9568" />
```

Fields that represent sentence boundaries have a value of ".", for example:

```
<SpeechToTextWord start="3.1562" duration="0.3568"
confidence="0.9568">.</SpeechToTextWord>
```

Categorize Documents

Categorization analyzes the concepts that exist in a document and, if those concepts match categories in IDOL Server, adds category information to the document. Categorizing documents is useful because you can alert IDOL users to new content that matches their interests, help them find information through taxonomies, and help them to identify similar documents.

To use categorization, you must have created and trained categories in IDOL Server. CFS queries IDOL by sending the `CategorySuggestFromText` action for each document, and IDOL returns information about any categories that match. If a document does not match any of the categories in IDOL Server, the document is not categorized. For information about how to create and train categories, refer to the *IDOL Server Administration Guide*.

To categorize documents

1. Stop CFS.
2. Open the CFS configuration file.
3. Create an import task to run the `CategorySuggestFromText` Lua script that is supplied with CFS. For example:

   ```
   [ImportTasks]
   Post0=Lua:./scripts/CategorySuggestFromText.lua
   ```
4. Open the script in a text editor.
5. Modify the variables in the script so that the script sends actions to your IDOL Server:

Line	Variable name	Value
178	`idolCategorizeHost`	The host name or IP address of your IDOL Server.
179	`idolCategorizePort`	The ACI port of your IDOL Server. The `port` argument in the function `send_aci_action` expects a number, so do not surround the port number with quotation marks.
184	`timeoutMilliseconds`	The amount of time, in milliseconds, that CFS waits for a response from your IDOL Server. If CFS does not receive a response within this time limit and the number of retries is reached, the document is not categorized. You should not need to modify the default value, which is 60 seconds.
185	`retries`	The number of times that CFS retries a request to your IDOL Server, if the first attempt is not successful.
186-192	`sslParameters`	A table of SSL parameters for connecting to your IDOL Server. For more information about the SSL parameters that you can set, refer to the *Connector Framework Server Reference*.

   For example:

   ```
   local idolCategorizeHost = "10.0.0.1"
   local idolCategorizePort = 9000

   ...

   local timeoutMilliseconds = 30000
   local retries = 3
   ```

```
local sslParameters =
   {
       SSLMethod = "SSLV23",
       --SSLCertificate = "host1.crt",
       --SSLPrivateKey = "host1.key",
       --SSLCACertificate = "trusted.crt"
   }
```

6. Save and close the script.

Customize the Query

The `CategorySuggestFromText` Lua script sends an entire document (metadata and content) to IDOL for categorization. The document is converted to a string using the `to_idx` method and then passed to the `QueryText` parameter of the `CategorySuggestFromText` action:

```
local categorySuggestFromTextParameters = { QueryText = document:to_idx() }

...

local output = send_aci_action(
               idolCategorizeHost,
               idolCategorizePort,
               "categorysuggestfromtext",
               categorySuggestFromTextParameters,
               timeoutMilliseconds,
               retries,
               sslParameters
               )
```

You can modify the script to categorize the document based on a specific field. For example, to use only the document content:

```
local categorySuggestFromTextParameters = {
                     QueryText = document:getContent()
                     }
```

Alternatively, to use the value of a single document field:

```
local categorySuggestFromTextParameters = {
                     QueryText = document:getFieldValue("MyFieldName")
                     }
```

You can also add additional parameters to the action. For example, the `CategorySuggestFromText` Lua script does not limit the number of categories that are added to the document. To add only the most relevant category to a document, add the `CategorySuggestFromText` action parameter `NumResults=1` by modifying the script as follows:

```
local categorySuggestFromTextParameters = {
                     QueryText = document:getContent(),
                     NumResults = 1
                     }
```

For more information about the `CategorySuggestFromText` action and the parameters that it supports, refer to the *IDOL Server Reference*.

Customize the Output

The `CategorySuggestFromText` Lua script creates the following document fields by default:

Field name	Value
`category_title`	The name of the category.
`category_id`	The ID of the category in IDOL Server.
`category_reference`	The `DREREFERENCE` of the category, stored as a document in the Agentstore.

The script adds one value to each field for each category that matches the document. For example:

```
#DREFIELD category_id="200"
#DREFIELD category_id="100"
#DREFIELD category_reference="200"
#DREFIELD category_reference="100"
#DREFIELD category_title="Science"
#DREFIELD category_title="BusinessNews"
```

To modify how the information is added to the document, customize the Lua script. For example, to change the names of the fields, modify the first argument of the `addField` method on lines 211 to 213:

```
document:addField("category_name", category["title"])
document:addField("category_ref", category["reference"])
document:addField("category_id", category["id"])
```

To add only the category names, remove lines 212 and 213:

```
document:addField("category_title", category["title"])
-- document:addField("category_reference", category["reference"])
-- document:addField("category_id", category["id"])
```

To add all of the category information to a single field, using subfields, you could modify the script as follows (replacing lines 207-219):

```
if(suggestWasSuccessful) then
   local suggestedCategories = parseCategories(output)

   document:addField("category", "category information")
   local field = document:getField("category")
   for i, category in ipairs(suggestedCategories) do
       field:addField("title",category["title"])
       field:addField("reference",category["reference"])
       field:addField("id",category["id"])
   end

   document:setFieldValue("result", output)
```

```
   return true
end
```

To add all of the category names to a single field as a comma-separated list, you could modify the script as follows (replacing lines 207-219):

```
if(suggestWasSuccessful) then
   local suggestedCategories = parseCategories(output)

   local names=""
   for i, category in ipairs(suggestedCategories) do
       if i==1 then
          names = category["title"]
       else
          names = names .. "," .. category["title"]
       end
   end

   if names~="" then
      document:addField("category_names_CSV", names)
   end

   document:setFieldValue("result", output)

   return true
end
```

Run Eduction

Eduction identifies and extracts entities from text, based on a pattern that you define. An *entity* is a word, phrase, or block of information. A *pattern* might be a dictionary, for example a list of people or places. Alternatively, the pattern can describe what the entity looks like without having to list it explicitly, for example a regular expression that describes an address or telephone number. After entities are extracted the text is written to the document fields that you specify. For more information about Eduction, refer to the *IDOL Eduction User Guide*.

You can run Eduction on document fields using the `Eduction` task.

> **NOTE:** To use the `Eduction` task you must have a license for Eduction and the relevant grammar files, and specify the host name and ACI port of your License Server in the CFS configuration file.

You can run the `Eduction` task using the `Post` parameter. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Post0=Eduction:EductionSettings

[EductionSettings]
```

```
ResourceFiles=C:\MyGrammar\gram1.ecr
SearchFields=DRECONTENT
Entity0=edk_common_entities/postal_address
EntityField0=SHIPPING_ADDRESS
```

Redact Documents

You can use the `Eduction` task to redact information in documents.

To enable redaction, set the configuration parameter `RedactedOutput=True`. If you want to specify the value or characters that replace the redacted text, use the configuration parameter `RedactionOutputString` or `RedactionReplacementCharacter`.

For example, the following configuration redacts addresses contained in a document's `DRECONTENT` or `ADDRESS` fields:

```
[ImportTasks]
Post0=Eduction:EductionSettings

[EductionSettings]
ResourceFiles=C:\Autonomy\IDOLServer\Eduction\address_gb.ecr
SearchFields=DRECONTENT,ADDRESS
RedactedOutput=True
```

The fields specified by `SearchFields` are not modified. CFS places the redacted text in fields with a `_REDACTED` suffix. For example:

```
#DREFIELD ADDRESS="Cambridge Business Park, Cowley Road, Cambridge, CB4 0WZ"
#DREFIELD ADDRESS_REDACTED="[redacted]"
```

The `Eduction` task also adds the value, offset, and score for any matched entities to the document. For example:

```
#DREFIELD /offset="298"
#DREFIELD /score="1"
#DREFIELD /value="Cambridge Business Park, Cowley Road, Cambridge, CB4 0WZ"
```

Lua Post Processing

An *Eduction Lua Post Processing task* runs a Lua script that modifies the output from the Eduction module. For example, you might want to increase the score for a match if it is found near similar matches.

> **NOTE:** The Lua script is run by the Eduction module, not by CFS. The Eduction module expects the script to start with `function processmatch (edkmatch)`. You cannot modify the document being processed by CFS, or use the Lua methods that are available to CFS Lua scripts. For information about the Lua methods that are available in the Eduction module, refer to the *Eduction User Guide*.

To create an Eduction Lua Post Processing task, set the `PostProcessingTaskN` parameter. This specifies the name of a section in the CFS configuration file that contains parameters to configure the task. For example:

```
[ImportTasks]
Post0=Eduction:EductionSettings

[EductionSettings]
ResourceFiles=C:\MyGrammar\gram1.ecr
SearchFields=DRECONTENT
Entity0=edk_common_entities/postal_address
EntityField0=SHIPPING_ADDRESS
PostProcessingTask0=EductionLuaPostProcessing

[EductionLuaPostProcessing]
Script=scripts/eduction_post_process.lua
ProcessEnMasse=False
```

The Eduction Lua module will call `function processmatch (edkmatch)`. For example:

```
function processmatch(edkmatch)
   if edkmatch then
      local text = edkmatch:getOutputText()
      -- modify the match
      edkmatch:setOutputText(text)
      return true
   end

   return false -- return false to drop the match
end
```

The `edkmatch` argument represents a single eduction match, or the complete set of matches if you set the configuration parameter `ProcessEnMasse` to `true`.

If the `processmatch` function returns `true`, the match is returned to CFS. If the function returns `false`, the match is discarded.

For more information about writing Eduction post-processing scripts, and information about the Lua methods that you can use, refer to the *Eduction User Guide*.

Process HTML

Connectors, including the IDOL Web Connector, can send documents to CFS that have associated HTML files.

CFS can send the HTML files to KeyView, which discards the HTML markup and extracts the text contained in the file. However, HTML pages often contain irrelevant content such as invalid HTML, headers, sidebars, advertisements, and scripts. This text does not contain any useful information and could pollute the IDOL index, degrading performance. KeyView does not remove this irrelevant content, so Connector Framework Server provides features to process HTML files.

- **HTML processing with WKOOP**. CFS can use an embedded browser (WKOOP) to process HTML in a similar way to the IDOL Web Connector. There are many reasons to use WKOOP over other methods of processing HTML:
  - The browser allows scripts to run before the page is processed, so CFS can extract content and links that are added by JavaScript.
  - Links are resolved before a document is ingested, so that indexed documents contain absolute URLs.
  - You can remove unwanted content using the automatic clipping algorithm, or by selecting parts of the page with CSS selectors.
  - You can extract metadata or divide pages into multiple documents using CSS selectors rather than regular expressions.

  NOTE: To use WKOOP you must also install the IDOL Web Connector, because WKOOP is not provided with CFS. You must install a version of WKOOP that is the same as, or later than, the version of CFS that you are using.
- **HTMLExtraction**. HTML extraction extracts the useful information from the page and discards the irrelevant content. It automatically determines which content is relevant, so there are no configuration parameters for customizing this operation. If HTML extraction does not produce good results for your use case, you might want to use the clipping features provided by WKOOP, instead.

HTML Processing with WKOOP

The `WKOOPHtmlExtraction` task processes an HTML file that is associated with a document. It extracts links and metadata and adds these to the document in a metadata field named `HTML_PROCESSING`. The task appends a page to the document content that contains the plain text extracted from the HTML source. It also sets the field `AUTN_NO_FILTER`, to prevent the document being processed by KeyView.

This section describes how to configure HTML processing with WKOOP.

You can configure WKOOP HTML extraction as a pre-import task (`Pre0` in the following example). The `Pre0` parameter also specifies the name of a section that contains the settings for the task. In the following example the section is named `HtmlProcessingSettings`.

```
[ImportTasks]
Pre0=WKOOPHtmlExtraction:HtmlProcessingSettings

[HtmlProcessingSettings]
WKOOPPath=F:\IDOL\WebConnector\WKOOP.exe
ProxyHost=proxy.domain.com
ProxyPort=8080
SSLMethod=NEGOTIATE
ExtractLinks=TRUE
ResolveLinks=TRUE
Url=https://www.example.com/
```

The `WKOOPPath` parameter specifies the path to WKOOP. WKOOP is not included with CFS, so you must install the IDOL Web Connector and specify the path to the WKOOP executable file. You must install a version of WKOOP that is the same as, or later than, the version of CFS that you are using.

If you are running CFS on a machine that is behind a proxy server, set the `ProxyHost` and `ProxyPort` parameters to specify the proxy server to use to access the web. The `SSLMethod` parameter specifies the version of SSL or TLS to use when connecting to the web site, and is necessary to retrieve resources over HTTPS. Setting this parameter to `NEGOTIATE` uses the latest version that is supported by both CFS and the web server.

The `ExtractLinks` parameter accepts a Boolean value that specifies whether to extract links from HTML pages and add the links to the document metadata. When `ResolveLinks=TRUE` the links are resolved so that indexed documents contain absolute URLs. The `Url` parameter specifies the source URL so that links can be resolved. You do not need to specify the exact URL of the page being processed, as long as all URLs in the document being processed are relative to the web server.

For a full list of configuration parameters that you can use to configure WKOOP HTML extraction, refer to the *Connector Framework Server Reference*.

Remove Irrelevant Content

To remove irrelevant content from HTML pages using the automatic clipping algorithm, add the parameter `Clipped=TRUE` to your task configuration. CFS decides which parts of the page to keep and which to discard.

The automatic clipping algorithm has been designed to work with many different pages, but this means that automatic clipping might not give the best results for every page. Alternatively, you can use CSS selectors to choose which parts of the page to keep and which to discard. To clip pages with CSS selectors, add `Clipped=TRUE` to your task configuration, and then set `ClipPageUsingCssSelect` to specify the parts of the page to keep and `ClipPageUsingCssUnselect` to specify the parts of the page to remove. These parameters accept standard CSS2 selectors.

You can also remove scripts and hidden content from the HTML page:

- Remove all scripts from the HTML page by setting `RemoveScripts=TRUE`.
- Remove "noframes" content by setting `RemoveNoframes=TRUE`. When web developers use frames they might include content in a `<noframes></noframes>` element, for web browsers that do not support frames. This content might duplicate content elsewhere in the HTML page or simply contain a message that the browser does not support frames.

Extract Metadata

This section demonstrates how to extract metadata from an HTML page and add it to a document field.

Consider the following HTML:

```
<h1>This is a title</h1>
<h2>This is a sub-title</h2>
<p class="important">This is <strong>important</strong> text</p>
```

From this HTML you could extract all of the headings and add them to a metadata field named `heading`. You could also extract the important text and add that to a separate document field.

The configuration parameters `MetadataSelector` and `MetadataFieldName` select the information to extract and provide the name of the destination document field. These parameters must be set in numbered pairs (so that each `MetadataSelector` parameter has a matching `MetadataFieldName`). The `MetadataSelector` parameter accepts standard CSS2 selectors.

The following configuration would extract the information described above:

```
MetadataSelector0=h1,h2,h3
MetadataFieldName0=heading
MetadataSelector1=p.important
MetadataFieldName1=important_paragraph
MetadataSelectorExtractPlainText=TRUE
```

The parameter `MetadataSelectorExtractPlainText` specifies whether to extract as plain text (removing HTML markup, for example).

The configuration above would produce the following metadata fields:

```
#DREFIELD heading="This is a title"
#DREFIELD heading="This is a sub-title"
#DREFIELD important_paragraph="This is important text"
```

Split Web Pages into Multiple Documents

You might want to split pages into multiple documents. For example, if you ingest pages from a discussion board you might want to ingest one document for each message on the page.

Connector Framework Server can create documents for sections of a Web page identified using CSS selectors. CFS creates a child document for each section of the page that is identified. Metadata fields (named `CHILD_DOCUMENT`) are added to the parent document, to refer to the child documents.

To split pages into multiple documents, add the following parameters to your `WKOOPHtmlExtraction` task:

`ChildDocumentSelector`	A CSS2 selector that identifies the root element of each child document in the page source.
`ChildReferenceSelector`	(Optional) An element in the child document that contains a value to use as the document reference. The value you extract should be unique for each child document, because it is used as part of the `DREREFERENCE` field in the child document. If you do not set this parameter, the connector uses a GUID. Specify the element using a CSS2 selector, relative to the element identified by `ChildDocumentSelector`.
`ChildMetadataSelector`	(Optional) A list of elements in the child document that contain metadata. The metadata in these elements are extracted and added to the metadata fields of child documents. Specify the elements as a list of CSS2 selectors, relative to the element identified by `ChildDocumentSelector`. To specify the name(s) of the document field(s) to contain the extracted information, set the configuration parameter `ChildMetadataFieldName`. Both parameters must have the same

	number of values.
`ChildMetadataFieldName`	(Optional) The names to use for document fields (in child documents) that contain information extracted using the parameter `ChildMetadataSelector`. This parameter must have the same number of values as `ChildMetadataSelector`.

For example, consider the following example page which represents messages on a page of a discussion board:

```
<html>
    <head>
        <title>Example Page</title>
        <meta charset="utf-8">
    </head>
    <body>
        <div>
            <h1>Example Page</h1>
            <div class="content">
                <p>content</p>
            </div>
            <div class="message">
                <h1>Message 1</h1>
                <p class="meta">some metadata</p>
                <p>some content</p>
            </div>
            <div class="message">
                <h1>Message 2</h1>
                <p class="meta">some metadata</p>
                <p>some content</p>
            </div>
            ...
        </div>
    </body>
</html>
```

To create separate documents for the messages contained on this page, you could use the following configuration:

```
[MyTask]
...
ChildDocumentSelector=div.message
ChildReferenceSelector=h1
ChildMetadataFieldName0=my_metadata
ChildMetadataSelector0=p.meta
```

This example would produce the following child document (and a similar document for the second message):

```
#DREREFERENCE <current_document_reference>:<child_reference>
#DREFIELD my_metadata="some metadata"
```

```
...
#DRECONTENT
Message 1
some metadata
some content
...
```

The value of the DREREFERENCE field is constructed from the reference of the original document and the value of the element identified by the ChildReferenceSelector configuration parameter. If you don't set this configuration parameter or the element is not found, CFS uses a GUID instead.

CFS adds the reference of the original document to the fields DREPARENTREFERENCE and DREROOTPARENTREFERENCE. It also adds an HTML_PROCESSING metadata field that contains any metadata and links that are extracted from the child document.

The DRECONTENT field is populated with text extracted from the HTML elements that you identified as belonging to the child document.

Connector Framework Server automatically adds fields to the parent document, named CHILD_DOCUMENT, that contain the references of associated child documents.

HTML Extraction

HTML pages often contain irrelevant content such as invalid HTML, headers, sidebars, advertisements, and scripts. CFS can extract the useful information from the page and discard the irrelevant content.

To extract the useful information from an HTML page, use the HtmlExtraction import task. This task works only on HTML files and ignores other file types.

CFS reads the HTML document, and discards data such as invalid HTML, headers, sidebars, advertisements, and scripts. In the remaining content, CFS then extracts blocks of text that contain a large number of stopwords and a low proportion of links. This text is likely to be the most important content. Because CFS automatically determines which content is relevant, there are no configuration parameters for customizing this task.

Micro Focus recommends that you configure the HtmlExtraction task as a *Pre* import task. For example:

```
[ImportTasks]
Pre0=HtmlExtraction
```

After extracting the useful information, the HTML Extraction task sets the document field AUTN_NO_FILTER, so that the HTML file is not processed by KeyView.

Extract Metadata from Files

The ExtractMetadata task extracts metadata from the file associated with a document. This task extracts a subset of the metadata obtained by standard KeyView filtering. It is faster than standard KeyView filtering and does not extract the file content.

> **TIP:** When documents are ingested, CFS automatically extracts metadata. Do not use this task unless you have set the fields `AUTN_NO_FILTER` and `AUTN_NO_EXTRACT` on a document and want to extract basic metadata only.

The `ExtractMetadata` task is configured as a *Pre* task. Specify the name of the section that contains settings for the task. For example:

```
[ExtractMetadata]
Pre0=Lua:scripts/nofilter.lua
Pre1=ExtractMetadata:ExtractMetadataSettings

[ExtractMetadataSettings]
FieldnamePrefix=FIELD_
ReservedFieldnames=Reserved1,Reserved2
```

The `Pre0` task runs a Lua script that adds the fields `AUTN_NO_FILTER` and `AUTN_NO_EXTRACT` to documents. Adding these fields prevents KeyView from filtering the documents and extracting subfiles.

The `Pre1` task runs the `ExtractMetadata` task using the settings contained in the `[ExtractMetadataSettings]` section of the CFS configuration file.

The `FieldnamePrefix` parameter specifies a prefix for the names of the metadata fields that are added to the document. The `ReservedFieldnames` parameter specifies a comma-separated list of field names that the task must not use. If the task needs to add a metadata field with one of the specified names, it prefixes the name with an underscore. For example, with the settings specified above, the task would not add a field named `FIELD_Reserved1`. Instead, the task would add `_FIELD_Reserved1`.

Import Content Into a Document

The `ImportFile` task imports a file and adds its content to the document being processed. CFS does not extract sub files from the file.

The `ImportFile` task can be configured as a *Pre* or *Post* task. When you create the task, specify the name of a document field that contains the path or URL of the file to import, for example:

```
Pre0=ImportFile:fieldname
Post0=ImportFile:fieldname
```

where **`fieldname`** is the name of the document field.

Alternatively, specify the name of a section in the configuration file that contains the settings for the task:

```
[ImportTasks]
Post0=ImportFile:MySettings

[MySettings]
Fieldname=field_containing_file_path_or_url
ProxyHost=10.0.0.1
ProxyPort=8080
SSLMethod=TLSV1
```

If the field contains a URL, CFS downloads the file and adds its content to the document.

Reject Invalid Documents

You can configure CFS to reject documents based on several criteria.

When documents are rejected, they are not processed by further tasks. You can index rejected documents or discard them:

- To index the documents into one or more indexes, such as an IDOL Error Server, set the parameters `OnErrorIndexerSections` and `IndexDatabase`. `OnErrorIndexerSections` specifies a list of configuration file sections to use to index a document. These sections must contain indexing parameters, such as the host name and ACI port of your IDOL Server. `IndexDatabase` specifies the name of the IDOL database into which the rejected documents are indexed. Before indexing a document, CFS writes the name of the filter that caused the document to be rejected to a field named `MATCHEDFILEFILTERS`.
- If you do not specify any indexing details, the documents are discarded. CFS writes a message to the import log showing that the document was rejected, and showing which filter caused the rejection.

Reject Documents with Binary Content

The `BinaryFileFilter` task rejects any documents that have been filtered as binary. This can occur when KeyView filtering fails, for example due to corrupt files.

When CFS detects a non-UTF8 character, it replaces the character with a hexadecimal character code. The `BinaryFileFilter` task detects these character codes and rejects documents where the proportion exceeds the limit set by the `ThresholdPercent` parameter.

The `BinaryFileFilter` task can be configured as a *Post* task. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Post0=BinaryFileFilter:BinaryFileFilterSettings

[BinaryFileFilterSettings]
ThresholdPercent=10
OnErrorIndexerSections=IdolErrorServer
IndexDatabase=IdolErrorReview
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Reject Documents with Import Errors

The `ImportErrorFilter` task rejects any documents for which errors have occurred. Errors can occur during KeyView filtering or during *pre* and *post* import tasks.

The `ImportErrorFilter` task can be configured as a *Post* task. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Post0=ImportErrorFilter:ImportErrorFilterSettings

[ImportErrorFilterSettings]
OnErrorIndexerSections=IdolErrorServer
IndexDatabase=IdolErrorReview
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Reject Documents with Symbolic Content

The `SymbolicContentFilter` task calculates the proportion of symbolic characters in a document. If the proportion of symbolic characters in the document content exceeds the limit specified by the `MaxSymbolicCharactersPercent` parameter, the document is rejected.

Symbolic characters are defined as any character between U+2000 and U+2FFF.

The `SymbolicContentFilter` task can be configured as a *Post* task. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Post0=SymbolicContentFilter:SymbolicContentFilterSettings

[SymbolicContentFilterSettings]
MaxSymbolicCharactersPercent=8
OnErrorIndexerSections=IdolErrorServer
IndexDatabase=IdolErrorReview
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Reject Documents by Word Length

The `WordLengthFilter` task calculates the average length of words in a document. If the average length of words in the document content (`DRECONTENT`) falls outside the limits specified by the `MinimumAverage` or `MaximumAverage` parameters, the document is rejected.

The `WordLengthFilter` task can be configured as a *Post* task. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Post0=WordLengthFilter:WordLengthFilterSettings

[WordLengthFilterSettings]
MinimumAverage=3.0
MaximumAverage=10.0
OnErrorIndexerSections=IdolErrorServer
IndexDatabase=IdolErrorReview
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Reject All Invalid Documents

The `BadFilesFilter` task rejects all documents that are considered to be invalid:

- Documents that have binary content.
- Documents for which import errors have occurred.
- Documents that have too high a proportion of symbolic content.
- Documents where the average word length is too long or too short.

`BadFilesFilter` must be configured as a *Post* task.

`BadFilesFilter` reads configuration parameters from the section of the configuration file that you specify in the `Post` parameter. In this section you can set parameters for each filter. In the example below, two parameters have been set to configure the word length filter:

```
[ImportTasks]
Post0=BadFilesFilter:BadFilesFilterSettings

[BadFilesFilterSettings]
MinimumAverage=3.0
MaximumAverage=10.0
OnErrorIndexerSections=IdolErrorServer
IndexDatabase=IdolErrorReview
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference.*

Split Document Content into Sections

Dividing the content of long documents into sections can result in more relevant search results, because IDOL Server can return a specific part of a document in response to a query.

To divide document content into sections, use the `Sectioner` task.

The `Sectioner` import task must be configured as a *Post* task. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Post0=Sectioner:Sectioning

[Sectioning]
SectionerMaxBytes=3000
SectionerMinBytes=1500
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Split Files into Multiple Documents

Sometimes you might retrieve files from a repository that you would prefer to ingest as multiple documents.

You can use the `TextToDocs` task to split a file containing text (for example an HTML file or XML file) into multiple documents. To divide a file, you specify regular expressions that match the relevant parts of the document. The task creates a main document and one or more child documents, which can all have metadata and content. When you run `TextToDocs` on a document, the original document is discarded. The documents created by `TextToDocs` are metadata-only documents, which means that they do not have an associated file and are not filtered by KeyView.

The `TextToDocs` task should be configured as a *Pre* task. The parameters that are passed to the task are specified in a named section of the configuration file. For example:

```
[ImportTasks]
Pre0=TextToDocs:MyTextToDocs

[MyTextToDocs]
...
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

The `TextToDocs` task expects documents to use UTF-8 character encoding. If your documents are not encoded in UTF-8 you can use the configuration parameter `SourceEncoding` to specify the character set encoding of the source documents, so that they can be converted to UTF-8. If conversion fails, the original encoding is used and CFS adds an error message to the `ImportErrorCode` and `ImportErrorDescription` document fields.

Example

The following HTML is an example file that you might want to ingest as separate documents. There are clear sections which could represent different topics:

```
<html>
  <body>
    <p class="main">Main content</p>

    <div class="section">
      <h1>First document</h1>
      <p class="metadata">Extract as metadata</p>
      <p>Some text</p>
    </div>

    <div class="section">
       <h1>Second document</h1>
       <p class="metadata">Extract as metadata</p>
       <p>Some text</p>
```

```
    </div>

    <div class="section">
       <h1>Third document</h1>
       <p class="metadata">Extract as metadata</p>
       <p>Some text</p>
    </div>

  </body>
</html>
```

You might want to split this file into a main document and three child documents, one of which might look like this:

```
#DREREFERENCE C:\MyFiles\TextToDocs\textToDocs.html:0
#DREDBNAME FileSystem
#DREFIELD MyMetadataField="Extract as metadata"
#DRECONTENT
First document
Some text

#DREENDDOC
```

To do this, you could use the following configuration:

```
[ImportTasks]
Pre0=TextToDocs:MyTextToDocs

[MyTextToDocs]
FilenameMatchesRegex0=.*\.html

MainRangeRegex0=<html>(.*)</html>
MainContentRegex0=<p class="main">(.*?)</p>

ChildrenRangeRegex0=<html>(.*)</html>
ChildRangeRegex=<div class="section">(.*?)</div>
ChildContentRegex0=<h1>(.*?)</h1>
ChildContentRegex1=<p>(.*?)</p>
ChildFieldName0=MyMetadataField
ChildFieldRegex0=<p class="metadata">(.*?)</p>
ChildInheritFields=DREDBNAME
```

In this example, the `FilenameMatchesRegex` parameter has been set to process only those files that have the extension `.html`.

The `MainContentRegex` parameter identifies parts of the original document to add to the `DRECONTENT` field of the main document.

The `ChildRangeRegex` parameter identifies the parts of the original document that should become child documents. The sub-match `(.*?)` matches all of the content between a `<div class="section">` tag and a `</div>` tag. When this regular expression is applied to the example document above, there are three matches and therefore three child documents are created. It is important to make the regular

expression lazy, because otherwise it would match everything between the first `<div class="section">` and the final `</div>`, resulting in a single child document.

The `ChildContentRegex` parameter identifies the content to add to the `DRECONTENT` field of a child document. In this example two regular expressions are used to extract content. The `ChildFieldName` and `ChildFieldRegex` parameters populate metadata fields. In this example a single field named `MyMetadataField` is created.

Setting the parameter `ChildInheritFields=DREDBNAME` specifies that the child documents inherit the field `DREDBNAME` from the original document. If you are indexing documents into IDOL Server it is important to set this parameter, because (depending on how your system is configured) documents without a `DREDBNAME` field might not be indexed.

Write Documents to Disk

CFS can write documents to disk in several formats. You might want to write documents to disk for the following reasons:

- so that you can see the data that is being indexed. You can then set up further processing tasks to manipulate and enrich the data.
- so that you can debug your Lua scripts or other processing tasks.
- so that you can export the data from documents to other systems.

Write Documents to Disk in IDX Format

To write documents to disk in IDX format, configure an `IdxWriter` processing task by setting the `Pre`, `Post`, `Update`, or `Delete` configuration parameter.

To run the `IdxWriter` task with default settings, use the `Pre`, `Post`, `Update`, or `Delete` parameter to specify the file name for the IDX file:

```
[ImportTasks]
Pre0=IdxWriter:pre.idx
Post0=IdxWriter:post.idx
```

Alternatively, set the parameter to `IdxWriter`, followed by a colon (`:`), followed by the name of the section in the configuration file that contains custom settings for the task. For example:

```
[ImportTasks]
Pre0=IdxWriter:PreIDX
Post0=IdxWriter:PostIDX

[PreIDX]
IdxWriterFilename=pre.idx
IdxWriterMaxSizeKBs=100
IdxWriterArchiveDirectory=./IDXArchive

[PostIDX]
IdxWriterFilename=post.idx
```

```
IdxWriterMaxSizeKBs=100
IdxWriterArchiveDirectory=./IDXArchive
```

For information about the configuration parameters you can use to configure this task, refer to the *Connector Framework Server Reference*.

Write Documents to Disk in XML Format

To write documents to disk in XML format, configure an `XmlWriter` processing task by setting the `Pre`, `Post`, `Update`, or `Delete` configuration parameter.

When you create the `XmlWriter` task, specify the file name of the XML file. For example:

```
[ImportTasks]
Pre0=XmlWriter:C:\ConnectorFrameworkServer\pre.xml
Post0=XmlWriter:C:\ConnectorFrameworkServer\post.xml
```

Write Documents to Disk in JSON Format

To write documents to disk in JSON format, configure a `JsonWriter` processing task by setting the `Pre`, `Post`, `Update`, or `Delete` configuration parameter.

To configure the task with default settings, specify the file name for the output file:

```
[ImportTasks]
Pre0=JsonWriter:pre.jsn
Post0=JsonWriter:post.jsn
```

Alternatively, set the parameter to `JsonWriter`, followed by a colon (`:`), followed by the name of the section in the configuration file that contains custom settings for the task. For example:

```
[ImportTasks]
Post0=JsonWriter:PostJsonWriting

[PostJsonWriting]
JsonWriterFilename=post.jsn
JsonWriterMaxSizeKBs=1000
JsonWriterArchiveDirectory=./JSONarchive
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Write Documents to Disk in CSV Format

The `CsvWriter` task writes document metadata and content to a comma-separated values (CSV) file. This allows you to export the data to other systems.

The task always writes the document reference (`DREREFERENCE`) and content (`DRECONTENT`) fields, and you can choose the other fields that you want to include. The task writes the field names, followed by one line of values for each document that is ingested.

The `CsvWriter` task can be configured as a *Pre*, *Post*, *Update* or *Delete* task.

To run the task with default settings, specify the file name for the output file:

```
[ImportTasks]
Post0=CsvWriter:MyTask.csv
```

Alternatively, specify the name of a section in the configuration file that contains the settings for the task:

```
[ImportTasks]
Post0=CsvWriter:CsvWriting

[CsvWriting]
CsvWriterFilename=MyTask.csv
CsvWriterMaxSizeKBs=1000
CsvWriterArchiveDirectory=./CSVarchive
CsvWriterFieldNames0=A_FIELD
CsvWriterFieldNames1=A_FIELD/subfield
CsvWriterFieldNames2=A_FIELD/@attribute
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Write Documents to Disk as SQL INSERT Statements

The `SqlWriter` task writes document metadata and content to a file in the form of SQL "INSERT" statements. You can use the SQL to insert the data from the documents into a database.

The task always writes the document reference (`DREREFERENCE`) and content (`DRECONTENT`) fields, and you can choose the other fields that you want to include. The task writes one INSERT statement for each document that is processed.

The `SqlWriter` task can be configured as a *Pre*, *Post*, *Update* or *Delete* task.

To configure the task, specify the name of a section that contains the settings, for example:

```
[ImportTasks]
Post0=SqlWriter:SqlWriting

[SqlWriting]
SqlWriterFileName=MyTask.sql
SqlWriterTableName=table
SqlWriterDreReferenceColumnName=REFERENCE
SqlWriterDreContentColumnName=CONTENT

SqlWriterFieldNames0=MODIFIED_DATE
SqlWriterColumnNames0=DATE
SqlWriterDataTypes0=DATE_TIME

SqlWriterUseNullForMissingFields=true

SqlWriterDateFormats0=DD/MM/YYYY
```

```
SqlWriterDateFormats1=YYYY/MM/DD

SqlWriterMaxSizeKBs=1024
SqlWriterArchiveDirectory=./SQLarchive
```

For information about the parameters that you can use to configure this task, refer to the *Connector Framework Server Reference*.

Standardize Document Fields

The documents created by your connectors might not have consistent field names. For example, documents created by the File System Connector can have a field named `FILEOWNER`. Documents created by the Documentum Connector can have a field named `owner_name`. Both of these fields store the name of the person who owns a file.

You might want to rename document fields so that documents use the same field names to store the same type of information. CFS includes the `standardizer` task to do this.

You can configure the `Standardizer` task as a *Pre* or *Post* task. For example:

```
[ImportTasks]
Post0=Standardizer
```

To use the `Standardizer` task, you must set the `EnableFieldNameStandardization` and `FieldNameDictionaryPath` configuration parameters in the `[ImportService]` section of the CFS configuration file. For more information about these parameters, refer to the *Connector Framework Server Reference*.

Customize Field Standardization

Field standardization modifies documents so that they have a consistent structure and consistent field names. You can use field standardization so that documents indexed into IDOL through different connectors use the same fields to store the same type of information. Field standardization only modifies fields that are specified in a dictionary, which is defined in XML format. A standard dictionary, named `dictionary.xml`, is supplied in the CFS installation folder.

In most cases you should not need to modify the standard dictionary, but you can modify it to suit your requirements or create dictionaries for different purposes. By modifying the dictionary, you can configure CFS to apply rules that modify documents before they are ingested. For example, you can move fields, delete fields, or change the format of field values.

The following examples demonstrate how to perform some operations with field standardization.

The following rule renames the field `Author` to `DOCUMENT_METADATA_AUTHOR_STRING`. This rule applies to all components that run field standardization and applies to all documents.

```
<FieldStandardization>
    <Field name="Author">
        <Move name="DOCUMENT_METADATA_AUTHOR_STRING"/>
    </Field>
</FieldStandardization>
```

The following rule demonstrates how to use the `Delete` operation. This rule instructs CFS to remove the field `KeyviewVersion` from all documents. The `Product` element ensures that this rule is run only by CFS.

```
<FieldStandardization>
    <Product key="ConnectorFrameWork">
        <Field name="KeyviewVersion">
            <Delete/>
        </Field>
    </Product>
</FieldStandardization>
```

There are several ways to select fields to process using the `Field` element.

Field element attribute	Description	Example

`name`	Select a field where the field name matches a fixed value.	Select the field `MyField`:
		`<Field name="MyField">`
		`...`
		`</Field>`
		Select the field `Subfield`, which is a subfield of `MyField`:
		`<Field name="MyField">`
		`<Field name="Subfield">`
		`...`
		`</Field>`
		`</Field>`

`path`	Select a field where its path matches a fixed value.	Select the field `Subfield`, which is a subfield of `MyField`.
		`<Field path="MyField/Subfield">`
		`...`
		`</Field>`

`nameRegex`	Select all fields at the current depth where the field name matches a regular expression.	In this case the field name must begin with the word `File`:
		`<Field nameRegex="File.*">`
		`...`
		`</Field>`

`pathRegex`	Select all fields where the path of the field matches a regular expression.
	This operation can be inefficient because every metadata field must be checked. If possible, select the fields to process another way.
		This example selects all subfields of `MyField`.
		`<Field pathRegex="MyField/[^/]*">`
		`...`
		`</Field>`
		This approach would be more efficient:

		<Field name="MyField"> <Field nameRegex=".*"> ... </Field> </Field>

You can also limit the fields that are processed based on their value, by using one of the following:

Field element attribute	Description	Example
matches	Process a field if its value matches a fixed value.	Process a field named MyField, if its value matches abc. <Field name="MyField" matches="abc"> ... </Field>
matchesRegex	Process a field if its entire value matches a regular expression.	Process a field named MyField, if its value matches one or more digits. <Field name="MyField" matchesRegex="\d+"> ... </Field>
containsRegex	Process a field if its value contains a match to a regular expression.	Process a field named MyField if its value contains three consecutive digits. <Field name="MyField" containsRegex="\d{3}"> ... </Field>

The following rule deletes every field or subfield where the name of the field or subfield begins with temp.

```
<FieldStandardization>
    <Field pathRegex="(.*/)?temp[^/]*">
        <Delete/>
    </Field>
</FieldStandardization>
```

The following rule instructs CFS to rename the field Author to DOCUMENT_METADATA_AUTHOR_STRING, but only when the document contains a field named DocumentType with the value 230 (the KeyView format code for a PDF file).

```
<FieldStandardization>
    <Product key="ConnectorFrameWork">
        <IfField name="DocumentType" matches="230"> <!-- PDF -->
            <Field name="Author">
                <Move name="DOCUMENT_METADATA_AUTHOR_STRING"/>
            </Field>
        </IfField>
```

```
    </Product>
</FieldStandardization>
```

> **TIP:** In this example, the `IfField` element is used to check the value of the `DocumentType` field. The `IfField` element does not change the current position in the document. If you used the `Field` element, field standardization would attempt to find an `Author` field that is a subfield of `DocumentType`, instead of finding the `Author` field at the root of the document.

The following rules demonstrate how to use the `ValueFormat` operation to change the format of dates. The only format that you can convert date values into is the IDOL AUTNDATE format. The first rule transforms the value of a field named `CreatedDate`. The second rule transforms the value of an attribute named `Created`, on a field named `Date`.

```
<FieldStandardization>
    <Field name="CreatedDate">
        <ValueFormat type="autndate" format="YYYY-SHORTMONTH-DD HH:NN:SS"/>
    </Field>
    <Field name="Date">
        <Attribute name="Created">
            <ValueFormat type="autndate" format="YYYY-SHORTMONTH-DD HH:NN:SS"/>
        </Attribute>
    </Field>
</FieldStandardization>
```

As demonstrated by this example, you can select field attributes to process in a similar way to selecting fields.

You must select attributes using either a fixed name or a regular expression:

Select a field attribute by name	`<Attribute name="MyAttribute">`
Select attributes that match a regular expression	`<Attribute nameRegex=".*">`

You can then add a restriction to limit the attributes that are processed:

Process an attribute only if its value matches a fixed value	`<Attribute name="MyAttribute" matches="abc">`
Process an attribute only if its value matches a regular expression	`<Attribute name="MyAttribute" matchesRegex=".*">`
Process an attribute only if its value contains a match to a regular expression	`<Attribute name="MyAttribute" containsRegex="\w+">`

The following rule moves all of the attributes of a field to sub fields, if the parent field has no value. The `id` attribute on the first `Field` element provides a name to a matching field so that it can be referred to by later operations. The `GetName` and `GetValue` operations save the name and value of a selected field or attribute (in this case an attribute) into variables (in this case `$'name'` and `$'value'`) which can be used by later operations. The `AddField` operation uses the variables to add a new field at the selected location (the field identified by `id="parent"`).

```
<FieldStandardization>
    <Field pathRegex=".*" matches="" id="parent">
        <Attribute nameRegex=".*">
            <GetName var="name"/>
            <GetValue var="value"/>
            <Field fieldId="parent">
                <AddField name="$'name'" value="$'value'"/>
            </Field>
            <Delete/>
        </Attribute>
    </Field>
</FieldStandardization>
```

The following rule demonstrates how to move all of the subfields of `UnwantedParentField` to the root of the document, and then delete the field `UnwantedParentField`.

```
<FieldStandardization id="root">
    <Product key="ConnectorFrameWork">
        <Field name="UnwantedParentField">
            <Field nameRegex=".*">
                <Move destId="root"/>
            </Field>
            <Delete/>
        </Field>
    </Product>
</FieldStandardization>
```

Normalize E-mail Addresses

Documents can contain e-mail addresses in many formats, and often the name of the sender or recipient is contained in the same metadata field as their e-mail address.

The `EmailAddressNormalisation` task searches metadata fields for the names and e-mail addresses of e-mail senders and recipients. It then writes the information back to the document in a standard format. For named e-mail addresses (`"Name" <name@domain.com>`), the task separates the name from the address. The task also converts all e-mail addresses to lower-case.

For example, a document might include the following field:

```
<To>"One, Some" <Someone@Somewhere.com>, <user.name@domain.com>, "Else, Someone" <
SomeoneElse@Somewhere.com ></To>
```

The `EmailAddressNormalisation` task reads this information and adds the following fields to the document:

```
<to_email>someone@somewhere.com</to_email>
<to_email>user.name@domain.com</to_email>
<to_email>someoneelse@somewhere.com</to_email>
<to_name>One, Some</to_name>
<to_name/>
<to_name>Else, Someone</to_name>
```

As shown in the previous example, when an e-mail address does not have an associated name, an empty name field is added to the document. This is necessary because the order of the fields in the document is the only way to determine which name belongs with which e-mail address. The first e-mail address is associated with the first name, the second e-mail address with the second name, and so on.

This means that if your source field does not contain any names:

```
<To>Someone@Somewhere.com, SomeoneElse@Somewhere.com</To>
```

The task writes the following fields to the document:

```
<to_email>someone@somewhere.com</to_email>
<to_email>someoneelse@somewhere.com</to_email>
<to_name/>
<to_name/>
```

You can configure `EmailAddressNormalisation` as a *Pre* or *Post* task. For example:

```
[ImportTasks]
Post0=EmailAddressNormalisation:EmailAddressNormalisationSettings

[EmailAddressNormalisationSettings]
FieldNameRegex="To","From","Cc","Bcc"
AddresseeFieldName="to_name","from_name","cc_name","bcc_name"
EmailFieldName="to_email","from_email","cc_email","bcc_email"
```

The `Post0` task runs e-mail address normalisation using the settings in the `[EmailAddressNormalisationSettings]` section. The `FieldNameRegex` parameter specifies a list of regular expressions that identify the fields to process. The `AddresseeFieldName` and `EmailFieldName` parameters specify the names of the fields to add to the document. CFS adds the name of the sender or recipient to the addressee field and their e-mail address to the e-mail field.

Language Detection

CFS can identify the language of a document, and write the name of the language to a document field. A front-end application could use this field to provide a way to filter documents by language. You can also use language detection to reject invalid documents (when a language cannot be detected).

Language detection can be configured as a post-import task. Set the `Post` parameter to `LangDetect` and specify the name of a configuration file section that contains the task settings. For example:

```
[ImportTasks]
Post0=LangDetect:LangDetectSettings
```

```
[LangDetectSettings]
LanguageDetectionDirectory=./filters/datafiles/
OutputField=DetectedLanguage
FailIfLanguageUnknown=TRUE
```

You must set the parameter `LanguageDetectionDirectory` to the path of the folder that contains the file `langdetect.dat`. The remaining parameters are optional. The parameter `OutputField` specifies the name of the document field to write the name of detected language to. By default, CFS rejects documents where it cannot detect a language but you can configure this by setting `FailIfLanguageUnknown`. To continue processing documents when a language cannot be detected, set `FailIfLanguageUnknown=FALSE`.

Translate Documents

CFS can use third-party translation services to translate documents into other languages. This can be useful when you have documents that are not in your users' native language.

> **IMPORTANT:** To perform translation, you must have a license for one of the supported translation services. CFS relies on third-party services to translate text between languages. The language translation library that CFS uses to communicate with third-party translation services is not included in the standard CFS installation but can be obtained through Micro Focus software support.

Micro Focus recommends that you configure the `LanguageTranslation` task as a post-import task. Use the `Post` parameter to specify the name of a section that contains the task settings.

The following is an example task that uses the translation services provided by an SDL Enterprise Translation Server:

```
[ImportTasks]
Post0=Library:LanguageTranslation

[LanguageTranslation]
Library=LanguageTranslation
TranslatorType=SdlEts
ApiBaseUrl=https://host:port
ApiKey=0a12b34c56d78e9
SourceField=DRECONTENT
TargetField=DRECONTENT
TargetLanguage=ENG
Quality=medium-high
```

The following is an example task that uses the translation services provided by sdlbeglobal.com:

```
[ImportTasks]
Post0=Library:LanguageTranslation

[LanguageTranslation]
Library=LanguageTranslation
TranslatorType=SdlBeGlobal
```

```
AccountId=12345
ApiKey=0a12b34c56d78e9
UserId=23456
TouchpointId=34567
SourceField=DRECONTENT
TargetField=DRECONTENT
TargetLanguage=ENG
```

In both cases, the `TranslatorType` configuration parameter specifies the type of translation service to use. To use an SDL Enterprise Translation Server, set this parameter to `SdlEts`. To use the services that are provided by `sdlbeglobal.com`, set this parameter to `SdlBeGlobal`. You must then set the relevant parameters that are required to use the API:

- To use an SDL Enterprise Translation Server, set the configuration parameter `ApiBaseUrl` to the base URL of the API to use for translation, and the `ApiKey` parameter to the API key.
- To use the services provided by sdlbeglobal.com, set the parameters `AccountId`, `ApiKey`, `UserId` and `TouchpointId` to the values provided by SDL.

The remaining parameters are optional but you can set these to customize the task to your use case.

The `SourceField` configuration parameter specifies the name of the document field to translate, and the `TargetField` parameter specifies the name of the field to contain the results. If you specify the same field name for both parameters, CFS reads the text from the field, sends it for translation, and then writes the result back to the same field (which overwrites the original value).

The source language is detected automatically, but if automatic detection is not successful you can specify the source language by setting the configuration parameter `SourceLanguage`, which accepts the name of a language or a three-letter language code. Alternatively, you can configure the task to read the source language from a document field, by setting the parameter `SourceLanguageField`. For information about the languages that are supported, refer to the SDL documentation or translation service user interface.

The target language is specified by the configuration parameter `TargetLanguage`, which has a default value of `ENG` (English).

If you are using an SDL Enterprise Translation Server, you can also choose how to balance translation quality and speed by setting the `Quality` parameter.

For more information about the configuration parameters that you can use to configure the language translation task, refer to the *Connector Framework Server Reference*.

Chapter 8: Index Documents

This section describes how to configure indexing.

Introduction

The final step in the ingestion process is to index information into an index, such as an IDOL Content component. After CFS finishes processing documents, it automatically indexes them into the indexes that you have configured.

CFS can index documents into:

- **IDOL Content**.

  Index documents into IDOL Server to search, analyze, and find patterns in unstructured information. You can index documents directly into an IDOL Server, or send them to a Distributed Index Handler (DIH) to be distributed between multiple IDOL Servers in a distributed architecture.

- **Vertica**.

  Index documents into a Vertica database to analyze the structured information contained in your data repositories. Much of the metadata extracted by connectors and by KeyView is structured information held in structured fields, so you can use Vertica to gain insight into this information.

By default, CFS indexes each document into all of the indexes specified by the `IndexerSections` parameter in the `[Indexing]` section of its configuration file. However, if the document field `AUTN_INDEXER_SECTIONS` is set, CFS routes the document to the indexes specified in the field. The field accepts a comma-separated list of index names that must match the names of the sections in the CFS configuration file.

Configure the Batch Size and Time Interval

CFS indexes documents in batches. This is more efficient because fewer requests are made to the server.

Documents wait in the index queue until there are enough documents to create a batch, or until the maximum time interval for indexing is reached. If the time interval is reached, CFS indexes all of the documents in the queue regardless of the batch size.

To configure indexing settings

1. Stop CFS.
2. Open the CFS configuration file.
3. In the `[Indexing]` section, set the following configuration parameters:

`IndexBatchSize`	The number of documents to index in a single batch. CFS waits until this number of documents are ready for indexing, unless the `IndexTimeInterval` is reached.
`IndexTimeInterval`	The maximum amount of time, in seconds, that a document can wait in the index queue.

   For example:

   ```
   [Indexing]
   IndexBatchSize=1000
   IndexTimeInterval=600
   ```

4. Save the configuration file.

Index Documents into an IDOL Server

To index documents into an IDOL Server

1. Check that CFS is authorized to index documents into the IDOL index. In the IDOL Content configuration file, CFS must belong to an authorization role that includes the `admin`, `query`, and `index` standard roles.
2. Stop CFS.
3. Open the CFS configuration file.
4. In the `[Indexing]` section, use the `IndexerSections` parameter to specify the names of the sections that contain indexing settings. If this parameter is already set, add the name of the new indexer to the list. For example:

   ```
   [Indexing]
   IndexerSections=IdolServer
   ```

5. Create a new section in the CFS configuration file, with the same name that you specified in the `IndexerSections` parameter. In the new section, set the following parameters:

`Host`	The host name or IP address of the IDOL Server.

`Port`	The ACI Port of the IDOL Server.
`DefaultDatabaseName`	The name of the IDOL database to index a document into when the `DREDBNAME` document field is not set.
`SSLConfig`	(Optional) The name of a section in the CFS configuration file that contains SSL settings for connecting to IDOL. Set this parameter if your IDOL Server is configured to accept connections over SSL. For more information about the configuration parameters you can use to configure SSL connections, refer to the *Connector Framework Server Reference*.
`CreateDatabase`	(Optional, default `false`) Specifies whether IDOL should create databases that do not already exist. For example, if you set this parameter to `TRUE` and the database specified in a `DREDBNAME` document field does not exist, IDOL Server will create it.

For example:

```
[IdolServer]
Host=idol
Port=9000
DefaultDatabaseName=News
SSLConfig=SSLOptions

[SSLOptions]
SSLMethod=NEGOTIATE
```

For more information about these parameters and other parameters that you can set to customize the indexing process, refer to the *Connector Framework Server Reference*.

6. Save and close the configuration file.

Index Documents into Vertica

CFS can index documents into Vertica, so that you can run queries on structured fields (document metadata).

Depending on the metadata contained in your documents, you could:

- Investigate the average age of documents in a repository. You might want to answer questions such as: How much time has passed since the documents were last updated? How many files are regularly updated? Does this represent a small proportion of the total number of documents? Who are the most active users?
- Find the number of e-mail messages sent to your sales or support teams each week, and calculate the average response time to customer queries.

Prerequisites

- CFS supports indexing into Vertica 7.1 and later.
- You must install the appropriate Vertica ODBC drivers (version 7.1 or later) on the machine that hosts Connector Framework Server. If you want to use an ODBC Data Source Name (DSN) in your connection string, you will also need to create the DSN. For more information about installing Vertica ODBC drivers and creating the DSN, refer to the Vertica documentation.

New, Updated and Deleted Documents

When documents are indexed into Vertica, CFS adds a timestamp that contains the time when the document was indexed. The field is named `VERTICA_INDEXER_TIMESTAMP` and the timestamp is in the format `YYYY-MM-DD HH:NN:SS`.

When a document in a data repository is modified, CFS adds a new record to the database with a new timestamp. All of the fields are populated with the latest data. The record describing the older version of the document is not deleted. You can create a projection to make sure your queries only return the latest record for a document.

When a connector detects that a document has been deleted from a repository, CFS inserts a new record into the database. The record contains only the `DREREFERENCE` and the field `VERTICA_INDEXER_DELETED` set to `TRUE`.

Fields, Sub-Fields, and Field Attributes

Documents that are created by connectors and processed by CFS can have multiple levels of fields, and field attributes. A database table has a flat structure, so this information is indexed into Vertica as follows:

- Document fields become columns in the flex table. An IDOL document field and the corresponding database column have the same name.
- Sub-fields become columns in the flex table. A document field named `my_field` with a sub-field named `subfield` results in two columns, `my_field` and `my_field.subfield`.
- Field attributes become columns in the flex table. A document field named `my_field`, with an attribute named `my_attribute` results in two columns, `my_field` holding the field value and `my_field.my_attribute` holding the attribute value.

Prepare the Vertica Database

Indexing documents into a standard database is problematic, because documents do not have a fixed schema. A document that represents an image has different metadata fields to a document that represents an e-mail message. Vertica databases solve this problem with *flex tables*. You can create a flex table without any column definitions, and you can insert a record regardless of whether a referenced column exists.

You must create a flex table before you index data into Vertica.

When creating the table, consider the following:

- Flex tables store entire records in a single column named __raw__. The default maximum size of the __raw__ column is 128K. You might need to increase the maximum size if you are indexing documents with large amounts of content. Alternatively, you could configure CFS to remove content from documents before they are indexed.
- Documents are identified by their DREREFERENCE. Micro Focus recommends that you do not restrict the size of any column that holds this value, because this could result in values being truncated. As a result, rows that represent different documents might appear to represent the same document. If you do restrict the size of the DREREFERENCE column, ensure that the length is sufficient to hold the longest DREREFERENCE that might be indexed.

To create a flex table without any column definitions, run the following query:

```
create flex table my_table();
```

To improve query performance, create real columns for the fields that you query frequently. For documents indexed by CFS, this is likely to include the DREREFERENCE:

```
create flex table my_table(DREREFERENCE varchar NOT NULL);
```

You can add new column definitions to a flex table at any time. Vertica automatically populates new columns with values for existing records. The values for existing records are extracted from the __raw__ column.

For more information about creating and using flex tables, refer to the Vertica Documentation or contact Micro Focus Vertica technical support.

Configure CFS to Index into Vertica

The following procedure demonstrates a basic configuration that indexes all documents into a Vertica database.

However, you can customize the indexing process. For example, your CFS might be importing files from a File System Connector, e-mail messages from Exchange, and social media content. You might want to index these items into separate flex tables. To do this, you could run a Lua script to set the AUTN_INDEXER_SECTIONS field in each document, and create a separate indexing operation for each type of content.

To configure CFS to index documents into Vertica

1. Stop CFS.
2. Open the CFS configuration file.
3. In the [Indexing] section, use the IndexerSections parameter to specify the names of the sections that contain indexing settings. If this parameter is already set, add the name of the new indexer to the list. For example:

   ```
   [Indexing]
   IndexerSections=IdolServer,Vertica
   ```

4. Create a new section in the CFS configuration file, with the same name that you specified in the `IndexerSections` parameter. In the new section, set the following parameters:

`IndexerType`	The type of index to index documents into. Set this parameter to **`Library`**.
`LibraryDirectory`	The directory that contains the library to use to index data.
`LibraryName`	The name of the library to use to index data. You can omit the `.dll` or `.so` file extension. Set this parameter to **`verticaIndexer`**.
`ConnectionString`	The connection string to use to connect to the Vertica database.
`TableName`	The name of the table in the Vertica database to index the documents into. The table must be a flex table and must exist before you start indexing documents. For more information, see Prepare the Vertica Database, on page 108.

   For example:

```
[Vertica]
IndexerType=Library
LibraryDirectory=indexerdlls
LibraryName=verticaIndexer
ConnectionString=DSN=VERTICA
TableName=my_flex_table
```

   For more information about these parameters and other parameters that you can set to customize the indexing process, refer to the *Connector Framework Server Reference*.

5. Save and close the configuration file.

Troubleshooting

This section describes how to troubleshoot problems that might occur when you index data into Vertica.

Documents are not indexed into Vertica

Documents cannot be indexed when the Vertica database server is unavailable, or cannot be reached by CFS. To see whether an indexing error has occurred, check the CFS indexer log. The default location for this log file is `logs/indexer.log`. If documents were not indexed successfully, you will need to ingest these documents again.

Index Documents into another CFS

You can index documents into another CFS. You might want to do this if you want to perform further processing on them.

To index documents into another CFS

1. Stop CFS.
2. Open the CFS configuration file.
3. In the `[Indexing]` section, use the `IndexerSections` parameter to specify the names of the sections in the configuration file that contain indexing settings. If this parameter is already set, add the name of the new indexer to the list. For example:

   ```
   [Indexing]
   IndexerSections=IndexCFS
   ```

4. Create a new section in the CFS configuration file, with the same name that you specified in the `IndexerSections` parameter. In the new section, set the following parameters:

`IndexerType`	The type of index that you want to index documents into. Set this parameter to **`CFS`**.
`Host`	The host name or IP address of the CFS.
`Port`	The ACI Port of the CFS.
`SSLConfig`	(Optional) The name of a section in the CFS configuration file that contains SSL settings for connecting to the other CFS. Set this parameter if the CFS is configured to accept connections over SSL. For more information about the configuration parameters you can use to configure SSL connections, refer to the *Connector Framework Server Reference*.

   For example:

   ```
   [IndexCFS]
   IndexerType=CFS
   Host=cfs.domain.com
   Port=7000
   SSLConfig=SSLOptions

   [SSLOptions]
   SSLMethod=TLSV1.2
   ```

   For more information about these parameters and other parameters that you can set to customize the indexing process, refer to the *Connector Framework Server Reference*.

5. Save and close the configuration file.

Index Documents into MetaStore

To index documents into MetaStore

1. Stop CFS.
2. Open the CFS configuration file.
3. In the `[Indexing]` section, use the `IndexerSections` parameter to specify the names of the sections that contain indexing settings. If this parameter is already set, add the name of the new indexer to the list. For example:

   ```
   [Indexing]
   IndexerSections=IdolServer,MetaStore
   ```
4. Create a new section in the CFS configuration file, with the same name that you specified in the `IndexerSections` parameter. In the new section, set the following parameters:

`IndexerType`	Set this parameter to **`MetaStore`**.
`Host`	The host name or IP address of the MetaStore.
`Port`	The port of the MetaStore.
`SSLConfig`	(Optional) The name of the section in the CFS configuration file that contains the SSL settings to use for communicating with the MetaStore.

   For example:

   ```
   [MetaStore]
   IndexerType=MetaStore
   Host=localhost
   Port=4500
   ```

   For more information about these parameters and other parameters that you can set to customize the indexing process, refer to the *Connector Framework Server Reference*.
5. Save and close the configuration file.

Document Fields for Indexing

To customize the way that documents are indexed, set the following document fields.

AUTN_NO_INDEX

Documents that have this field are not indexed. You can use this field when you want to troubleshoot the ingestion process without indexing documents.

AUTN_INDEXER_SECTIONS

A comma-separated list of sections in the CFS configuration file to use to index the document. CFS indexes the document into all of the indexes that you specify. If this field is not set, CFS indexes the document into all of the indexes specified by the configuration parameter `IndexerSections`.

AUTN_INDEXPRIORITY

This field can be used to increase the priority of an index action sent to IDOL Server to index a batch of documents. You can specify a priority from 0 to 100, where 0 is the lowest priority and 100 is the highest. This means that you can configure some documents to be indexed before others, or before documents from sources other than CFS.

> **CAUTION:** Use this field with care. Modifying the index priority for documents changes the order of the index commands processed by IDOL. For example, in the case of an ingest-replace, the add command could be processed before the delete, resulting in a loss of data. Micro Focus recommends that you configure the indexing priority for batches of documents indexed into IDOL using the `IndexPriority` configuration parameter. This ensures that all of the batches indexed by CFS have the same priority.

If documents in a batch contain the field `INDEXPRIORITY`, and the value of this field is greater than that specified by the `IndexPriority` configuration parameter, the priority of the batch is increased to the highest `INDEXPRIORITY` field value present in the batch.

Manipulate Documents Before Indexing

CFS can index documents into multiple indexes. Normally, CFS indexes identical data into every index, but you might want to manipulate documents depending on the index that they are sent to. For example, if you are using Vertica to analyze structured information, you might want to remove the content from the documents indexed into Vertica, but keep the content in documents that are indexed into IDOL.

You cannot use import and index tasks to manipulate documents in this way, because those tasks affect documents sent to all of the indexes. To manipulate the documents sent to a single index, you can run a Lua script during the indexing process.

The script must define a `handler` function:

```
function handler(document, operation)
     -- do something, for example
     document:deleteField("UNINTERESTING_FIELD")
     return true
 end
```

The `operation` argument specifies the documents that you want to run the script on. This argument is a string and can be set to `add`, `update`, or `remove`:

- `add` - manipulate documents that are being added to the index. Ingest-adds are sent when a connector finds new documents in a repository, or when a document's content is changed (the old document is removed, and the new document added).
- `update` - manipulate documents that represent metadata updates.
- `remove` - manipulate documents that represent information deleted from the source repository.

To index the document the `handler` function must return `true`. To discard the document, return `false`.

To manipulate documents before indexing

1. Open the CFS configuration file.
2. In a section of the configuration file specified by the `IndexerSections` configuration parameter, set the `IndexLuaScript` parameter. This parameter specifies the path to the script that you want to run. For example:

```
[Indexing]
IndexerSections=IdolServer,Vertica

[Vertica]
IndexerType=Library
LibraryDirectory=indexerdlls
LibraryName=verticaIndexer
ConnectionString=DSN=VERTICA
TableName=my_flex_table
IndexLuaScript=./scripts/remove_content.lua
```

3. Save and close the configuration file.

Chapter 9: Monitor Connector Framework Server

This section describes how to monitor CFS.

Use the Logs

As Connector Framework Server runs, it outputs messages to log files. Most log messages occur due to normal operation, for example when CFS starts, receives actions, or processes documents. If CFS encounters an error, the logs are the first place to look for information to help troubleshoot the problem.

CFS separates log messages into the following message types, each of which relates to a specific feature:

Log Message Type	Description
`Action`	Logs actions that are received by CFS, and related messages.
`Application`	Logs application-related occurrences, such as when the CFS starts.
`Import`	Information about the import process. When you set `LogLevel` to `FULL`, CFS can log a significant amount of information about the import process, which might reduce performance.
`Indexer`	Information about the indexing process.

Customize Logging

You can customize logging by setting up your own *log streams*. Each log stream creates a separate log file in which specific types of message are logged.

To set up log streams

1. Open the CFS configuration file in a text editor.
2. Find the `[Logging]` section. If the configuration file does not contain a `[Logging]` section, create it.
3. In the `[Logging]` section, create a list of the log streams you want to set up using the format *`N=LogStreamName`*. List the log streams in consecutive order, starting from 0 (zero). For example:

   ```
   [Logging]
   LogLevel=NORMAL
   0=ApplicationLogStream
   1=ActionLogStream
   2=ImportLogStream
   3=IndexLogStream
   ```

   You can also use the `[Logging]` section to configure any default values for logging configuration parameters, such as `LogLevel`. For more information, refer to the *Connector Framework Server Reference*.
4. Create a new section for each of the log streams. Each section must have the same name as the log stream. For example:

   ```
   [ApplicationLogStream]
   [ActionLogStream]
   ...
   ```
5. Specify the settings for each log stream in the appropriate section. You can specify the type of logging to perform (for example, full logging), the maximum size of log files, and so on. For example:

   ```
   [ApplicationLogStream]
   LogTypeCSVs=application
   LogFile=application.log
   LogHistorySize=50
   LogTime=True
   LogEcho=False
   LogMaxSizeKBs=1024

   [ActionLogStream]
   LogTypeCSVs=action
   LogFile=action.log
   LogHistorySize=50
   LogTime=true
   LogEcho=false
   LogMaxSizeKBs=1024
   ```
6. Save and close the configuration file.
7. Restart CFS for your changes to take effect. For information about how to start and stop CFS, see Start and Stop Connector Framework Server, on page 30.

Monitor Asynchronous Actions using Event Handlers

Some of the actions that you can send to Connector Framework Server are asynchronous. Asynchronous actions do not run immediately, but are added to a queue. This means that the person or application that sends the action does not receive an immediate response. However, you can configure Connector Framework Server to call an event handler when an asynchronous action starts, finishes, or encounters an error.

You might use an event handler to:

- Return data about an event back to the application that sent the action.
- Write event data to a text file, to log any errors that occur.

You can also use event handlers to monitor the size of asynchronous action queues. If a queue becomes full this might indicate a problem, or that applications are making requests to Connector Framework Server faster than they can be processed.

Connector Framework Server can call an event handler for the following events.

OnStart	The `OnStart` event handler is called when Connector Framework Server starts processing an asynchronous action.
OnFinish	The `OnFinish` event handler is called when Connector Framework Server successfully finishes processing an asynchronous action.
OnError	The `OnError` event handler is called when an asynchronous action fails and cannot continue.
OnQueueEvent	The `OnQueueEvent` handler is called when an asynchronous action queue becomes full, becomes empty, or the queue size passes certain thresholds. • A `QueueFull` event occurs when the action queue becomes full. • A `QueueFilling` event occurs when the queue size exceeds a configurable threshold (`QueueFillingThreshold`) and the last event was a `QueueEmpty` or `QueueEmptying` event. • A `QueueEmptying` event occurs when the queue size falls below a configurable threshold (`QueueEmptyingThreshold`) and the last event was a `QueueFull` or `QueueFilling` event. • A `QueueEmpty` event occurs when the action queue becomes empty.

Connector Framework Server supports the following types of event handler:

- The `TextFileHandler` writes event data to a text file.
- The `HttpHandler` sends event data to a URL.
- The `LuaHandler` runs a Lua script. The event data is passed into the script.

Configure an Event Handler

To configure an event handler, follow these steps.

To configure an event handler

1. Stop Connector Framework Server.
2. Open the Connector Framework Server configuration file in a text editor.
3. Set the `OnStart`, `OnFinish`, `OnError`, or `OnQueueEvent` parameter to specify the name of a section in the configuration file that contains the event handler settings.
   - To run an event handler for all asynchronous actions, set these parameters in the `[Actions]` section. For example:

     ```
     [Actions]
     OnStart=NormalEvents
     OnFinish=NormalEvents
     OnError=ErrorEvents
     ```

   - To run an event handler for a specific action, set these parameters in the `[`*`ActionName`*`]` section, where *`ActionName`* is the name of the action. The following example calls an event handler when the *`Example`* action starts and finishes successfully, and uses a different event handler to monitor the queue size:

     ```
     [Example]
     OnStart=NormalEvents
     OnFinish=NormalEvents
     OnQueueEvent=QueueSizeEvents
     ```

4. Create a new section in the configuration file to contain the settings for your event handler. You must name the section using the name you specified with the `OnStart`, `OnFinish`, `OnError`, or `OnQueueEvent` parameter.
5. In the new section, set the `LibraryName` parameter.

`LibraryName`	The type of event handler to use to handle the event. • To write event data to a text file, set this parameter to **`TextFileHandler`**, and then set the `FilePath` parameter to specify the path of the file. • To send event data to a URL, set this parameter to **`HttpHandler`**, and then use the HTTP event handler parameters to specify the URL, proxy server settings, credentials, and so on. • To run a Lua script, set this parameter to **`LuaHandler`**, and then use the `LuaScript` parameter to specify the script to run. For information about writing the script, see Write a Lua Script to Handle Events, on the next page.

For example:

```
[NormalEvents]
LibraryName=TextFileHandler
FilePath=./events.txt

[ErrorEvents]
LibraryName=HTTPHandler
URL=http://handlers:8080/lo-proxy/callback.htm?

[QueueSizeEvents]
LibraryName=LuaHandler
LuaScript=./handle_queue_events.lua
```

6. Save and close the configuration file. You must restart Connector Framework Server for your changes to take effect.

Write a Lua Script to Handle Events

The Lua event handler runs a Lua script to handle events. The Lua script must contain a function named `handler` with the arguments `request` and `xml`, as shown below:

```
function handler(request, xml)
       ...
end
```

- `request` is a table holding the request parameters. For example, if the request was `action=Example&MyParam=Value`, the table will contain a key `MyParam` with the value `Value`. Some events, for example queue size events, are not related to a specific action and so the table might be empty.
- `xml` is a string of XML that contains information about the event.

Monitor the size of the Import and Index Queues

CFS generates events when the import queue and the outgoing (indexing) queue become full, become empty, or the queue size passes certain thresholds. If a queue approaches its maximum size, this might indicate a problem, or that applications are making requests to Connector Framework Server faster than they can be processed.

CFS generates the following events for each queue that is monitored:

- A `QueueFull` event occurs when the queue becomes full.
- A `QueueFilling` event occurs when the queue size exceeds a configurable threshold (`QueueFillingThreshold`) and the last event was a `QueueEmpty` or `QueueEmptying` event.
- A `QueueEmptying` event occurs when the queue size falls below a configurable threshold (`QueueEmptyingThreshold`) and the last event was a `QueueFull` or `QueueFilling` event.
- A `QueueEmpty` event occurs when the queue becomes empty.

You can configure event handlers to process these events. For example, you might want to notify an administrator if the size of a queue reaches 80 percent of the maximum.

To monitor queue sizes

1. Stop CFS.
2. Open the CFS configuration file in a text editor.
3. Set the `OnQueueEvent` parameter to the name of a section that configures the event handler.
   - To monitor the size of the import queue, set this parameter in the `[ImportService]` section. For example:

     ```
     [ImportService]
     OnQueueEvent=MyEventHandler
     ```

   - To monitor the size of the outgoing (indexing) queue, set this parameter in the `[Indexing]` section. For example:

     ```
     [Indexing]
     OnQueueEvent=MyEventHandler
     ```

4. Create a new section in the configuration file to contain the settings for your event handler. You must name the section using the name you specified with the `OnQueueEvent` parameter.
5. In the new section, set the `LibraryName` parameter.

   `LibraryName` The type of event handler to use to handle the event.

   - To write event data to a text file, set this parameter to **`TextFileHandler`**, and then set the `FilePath` parameter to specify the path of the file.
   - To send event data to a URL, set this parameter to **`HttpHandler`**, and then use the HTTP event handler parameters to specify the URL, proxy server settings, credentials, and so on.
   - To run a Lua script, set this parameter to **`LuaHandler`**, and then use the `LuaScript` parameter to specify the script to run. For information about writing the script, see Write a Lua Script to Handle Events, on the previous page.

   For example:

   ```
   [MyEventHandler]
   LibraryName=LuaHandler
   LuaScript=./handle_queue_event.lua
   ```

6. Save and close the configuration file. You must restart CFS for your changes to take effect.

Set Up Document Tracking

Document tracking reports metadata about documents when they pass through various stages in the ingestion and indexing process. Document tracking can help you detect problems with the indexing

process.

You can write document tracking events to a database, log file, or IDOL Server. For information about how to set up a database to store document tracking events, refer to the *IDOL Server Administration Guide*.

To enable Document Tracking

1. Open the CFS configuration file.
2. Create a new section in the configuration file, named `[DocumentTracking]`.
3. In the `[DocumentTracking]` section, specify where the document tracking events are sent.
   - To send document tracking events to a database through ODBC, set the following parameters:

`Backend`	To send document tracking events to a database, set this parameter to **`Library`**.
`LibraryPath`	Specify the location of the ODBC document tracking library. This is included with IDOL Server.
`ConnectionString`	The ODBC connection string for the database.

     For example:

     ```
     [DocumentTracking]
     Backend=Library
     LibraryPath=C:\Autonomy\IDOLServer\IDOL\modules\dt_odbc.dll
     ConnectionString=DSN=MyDatabase
     ```

   - To send document tracking events to the CFS import log, set the following parameters:

`Backend`	To send document tracking events to the logs, set this parameter to **`Log`**.
`DatabaseName`	The name of the log stream to send the document tracking events to. Set this parameter to **`import`**.

     For example:

     ```
     [DocumentTracking]
     Backend=Log
     DatabaseName=import
     ```

   - To send document tracking events to an IDOL Server, set the following parameters:

`Backend`	To send document tracking events to an IDOL Server, set this parameter to **`IDOL`**.
`TargetHost`	The host name or IP address of the IDOL Server.
`TargetPort`	The index port of the IDOL Server.

For example:

```
[DocumentTracking]
Backend=IDOL
TargetHost=idol
TargetPort=9001
```

For more information about the parameters you can use to configure document tracking, refer to the *Connector Framework Server Reference*.

4. Save and close the configuration file.

Appendix A: KeyView Supported Formats

This section lists the file formats that KeyView can process.

Supported Formats

The tables in this section provide the following information:

- The file formats that can be processed by KeyView, and the features that are supported for each format:
  - The **Filter** column specifies whether KeyView can extract the main content of the file (for example the text in a document or the body of an email message). CFS writes this text to the document content.
  - The **Extract** column specifies whether KeyView can extract subfiles from the file, if it is a container file.
- The file formats for which KeyView can detect and extract the character set and metadata information (properties such as title, author, and subject).

  Even though a file format might be able to provide character set information, some documents might not contain character set information. Therefore, the document reader would not be able to determine the character set of the document. In this case, either the operating system code page or the character set specified in the API is used.
- The document reader used to filter each format.

Key to Support Tables

Symbol	Description
Y	The format is supported. You can extract metadata for this format. You can determine the character set for this format.
N	The format is not supported. You cannot extract metadata for this format. You cannot determine the character set for this format.
P	Partial metadata is extracted from this format. Some non-standard fields are not extracted.
T	Only text is extracted from this format. Formatting information is not extracted.
M	Only metadata (title, subject, author, and so on) is extracted from this format. Text and formatting information are not extracted.

[1]The `kpODArdr` reader can filter, export, and view all versions but is supported only on Windows, Linux, and OSX. The `kpDWGrdr` reader is used on AIX, FreeBSD, Solaris, and SPARC platforms, but does not support graphics for versions after 2004 or text for versions after 2013.
[2]The `kpODArdr` reader can filter, export, and view all versions but is supported only on Windows, Linux, and OSX. The `kpDXFrdr` reader is used on AIX, FreeBSD, Solaris, and SPARC platforms, but does not support graphics for versions after 2004.
[3]All CAT file extensions, for example CATDrawing, CATProduct, CATPart, and so on.
[4]Viewing and Export use the graphic reader, kpVSD2rdr for Microsoft Visio 2003, 2007, and 2010, and vsdsr for all earlier versions. Image fidelity in Viewing and Export is therefore only supported for versions 2003 and above. Filter uses the graphic reader kpVSD2rdr for Microsoft Visio 2003, 2007, and 2010, and vsdsr for all earlier versions.
[5]Extraction of embedded OLE objects is supported for Filter on Windows platforms only.

[1]Supports non-encrypted embedded files only.

[2]KeyView supports MBX files created by Eudora Email and Mozilla Thunderbird. MBX files created by other common mail applications are typically filtered, converted, and displayed.

[3]This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

[1]KeyView provides several readers capable of processing PST files. The `pstsr` reader uses the Microsoft Messaging Application Programming Interface (MAPI), works only on Windows, and requires that you have Microsoft Outlook installed. The `pstxsr` reader is available for Windows (32-bit and 64-bit) and Linux (64-bit only) and does not require Microsoft Outlook. The `pstnsr` reader is an alternative reader that does not require Microsoft Outlook, for all platforms not supported by `pstxsr`.
[2]This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

[3]This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

[4]This reader supports both clear signed and encrypted S/MIME. KeyView supports S/MIME for PST, EML, MBX, and MSG files.

Multimedia Formats

Viewing SDK plays some multimedia files using the Windows Media Control Interface (MCI). MCI is a set of Windows APIs that communicate with multimedia devices.

Supported Multimedia Formats

NOTE: Depending on the default multimedia player installed on your computer, the View API might not be able to play some supported multimedia formats. To play multimedia files, the View API uses the Windows Media Control Interface (MCI) to communicate with the multimedia player installed on your computer. If the player does not play a multimedia file that is supported by the Viewing SDK, the View API cannot play the file.

If you cannot play a supported multimedia file by using the View API, install a different multimedia player or compressor/decompressor (codec) component.

Presentation Formats

[1]KeyView filters only the internal redirection text. The underlying document text is not accessible without the decryption key.

[2]KeyView filters only the internal redirection text. The underlying document text is not accessible without the decryption key.

[3]KeyView filters only the internal redirection text. The underlying document text is not accessible without the decryption key.

Supported Word Processing Formats, continued

Format	Version	Reader	Extension	Filter	Export	View	Extract	Metadata	Charset	Header/Footer
Yahoo! Instant Messenger	n/a	yimsr[1]	DAT	Y	Y	Y	N	N	N	N

[1]To successfully use this reader, you must set the `KV_YAHOO_ID` environment variable to the Yahoo user ID. You can optionally set the `KV_OTHER_YAHOO_ID` environment variable to the other Yahoo user ID. If you do not set it, "`Other`" is used by default. If you enter incorrect values for the environment variables, erroneous data is generated.

Appendix B: KeyView Format Codes

This section lists the KeyView format classes and codes used with Connector Framework Server.

KeyView Classes lists KeyView file classes. The numbers are reported in the `DocumentClass` field in documents processed by CFS. Consult the table to determine the file class that was imported.

Detected Formats lists all KeyView formats. The numbers are reported in the `DocumentType` field in documents processed by Connector Framework Server. Consult the table to determine the file type that was imported.

You can use any of the format numbers from Detected Formats in conjunction with the `ImportFamilyRootExcludeFmtCSV` parameter. For more information about this parameter, refer to the *Connector Framework Server Reference*.

KeyView Classes

File Classes

Attribute Number	Description
0	No file class
01	Word processor
02	Spreadsheet
03	Database
04	Raster image
05	Vector graphic
06	Presentation
07	Executable
08	Encapsulation
09	Sound
10	Desktop publishing
11	Outline/planning
12	Miscellaneous
13	Mixed format

File Classes, continued

Attribute Number	Description
14	Font
15	Time scheduling
16	Communications
17	Object module
18	Library module
19	Fax
20	Movie
21	Animation
22	Source Code
23	Computer-Aided Design
24	BI and analysis tools
25	Scientific data
26	Geographic Info System

Key to Detected Formats Table

The detected formats table includes the following information:

Column	Description
Format Name	The format name that is returned by KeyView format detection.
Number	The format number that is returned by KeyView format detection.
Description	A short description of the file format.
MIME Type	The MIME type (if any).
Extension	A list of common file extensions for the file format. This is not a complete list of file extensions. KeyView does not distinguish between file types based on their extension. Instead, it detects the file format based on the file content. This is more reliable because content cannot always be predicted from the file extension, and because some file extensions are associated with multiple formats.

Detected Formats

Format Name	Number	Description	MIME Type	Extension
Reserved__Fmt	-1			
Unknown_Fmt	0			
AES_Multiplus_Comm_Fmt	1	Multiplus (AES)		PTF
ASCII_Text_Fmt	2	Plain Text file	text/plain	TXT
MSDOS_Batch_File_Fmt	3	MS-DOS Batch File	application/x-bat	BAT
Applix_Alis_Fmt	4	APPLIX ASTERIX		AX
BMP_Fmt	5	Windows Bitmap Image (BMP)	image/bmp	BMP
CT_DEF_Fmt	6	Convergent Technologies DEF Comm. Format		
Corel_Draw_Fmt	7	Corel Draw (up to version 13/X3)	application/coreldraw	CDR
CGM_ClearText_Fmt	8	Computer Graphics Metafile (CGM)		CGM
CGM_Binary_Fmt	9	Computer Graphics Metafile (CGM)	image/cgm	CGM
CGM_Character_Fmt	10	Computer Graphics Metafile (CGM)		CGM
Word_Connection_Fmt	11	Word Connection		CN
COMET_TOP_Word_Fmt	12	Nixdorf COMET TOP Financial Accounting software		
CEOwrite_Fmt	13	CEOwrite		CW
DSA101_Fmt	14	DSA101 (Honeywell Bull)		
DCA_RFT_Fmt	15	DCA-RFT (IBM Revisable Form)	application/dca-rft	RFT, DC
CDA_DDIF_Fmt	16	CDA / DDIF		DDIF
DG_CDS_Fmt	17	DG Common Data Stream (CDS)		CDS
Micrografx_Draw_Fmt	18	Windows Draw (Micrografx)		DRW
Data_Point_VistaWord_Fmt	19	Vistaword		DV
DECdx_Fmt	20	DECdx		DX
Enable_WP_Fmt	21	Enable Word Processing		WPF
EPSF_Fmt	22	Encapsulated PostScript	application/postscript	EPS

Format Name	Number	Description	MIME Type	Extension
Preview_EPSF_Fmt	23	Encapsulated PostScript	application/postscript	
MS_Executable_Fmt	24	MSDOS/Windows Program	application/x-msdownload	EXE
G31D_Fmt	25	CCITT G3 1D		
GIF_87a_Fmt	26	Graphics Interchange Format (GIF87a)	image/gif	GIF
GIF_89a_Fmt	27	Graphics Interchange Format (GIF89a)	image/gif	GIF
HP_Word_PC_Fmt	28	HP Word PC		HW
IBM_1403_LinePrinter_Fmt	29	IBM 1403 Line Printer		I4
IBM_DCF_Script_Fmt	30	DCF Script		IC
IBM_DCA_FFT_Fmt	31	DCA-FFT (IBM Final Form)		IF, FFT
Interleaf_Fmt	32	Interleaf		
GEM_Image_Fmt	33	GEM Bit Image		IMG
IBM_Display_Write_Fmt	34	Display Write		IP
Sun_Raster_Fmt	35	Sun Raster	image/x-cmu-raster	RAS
Ami_Pro_Fmt	36	Lotus Ami Pro	application/x-lotus-amipro	SAM
Ami_Pro_StyleSheet_Fmt	37	Lotus Ami Pro Style Sheet		
MORE_Fmt	38	MORE Database MAC		
Lyrix_Fmt	39	Lyrix Word Processing		
MASS_11_Fmt	40	MASS-11		M1
MacPaint_Fmt	41	MacPaint		PNTG
MS_Word_Mac_Fmt	42	Microsoft Word for Macintosh (up to version 3)	application/msword	DOC
SmartWare_II_Comm_Fmt	43	SmartWare II		
MS_Word_Win_Fmt	44	Microsoft Word for Windows (up to version 6)	application/msword	DOC, WPS
Multimate_Fmt	45	MultiMate		MM
Multimate_Fnote_Fmt	46	MultiMate Footnote File		
Multimate_Adv_Fmt	47	MultiMate Advantage		
Multimate_Adv_Fnote_Fmt	48	MultiMate Advantage Footnote File		
Multimate_Adv_II_Fmt	49	MultiMate Advantage II		
Multimate_Adv_II_Fnote_Fmt	50	MultiMate Advantage II Footnote File		FBX, FNX

Format Name	Number	Description	MIME Type	Extension
Multiplan_PC_Fmt	51	Multiplan (PC)		
Multiplan_Mac_Fmt	52	Multiplan (Mac)		
MS_RTF_Fmt	53	Rich Text Format (RTF)	application/rtf	RTF
MS_Word_PC_Fmt	54	Microsoft Word for PC (up to version 6)	application/x-ms-wordpc	MW
MS_Word_PC_StyleSheet_Fmt	55	Microsoft Word for PC (up to version 6) Style Sheet		
MS_Word_PC_Glossary_Fmt	56	Microsoft Word for PC (up to version 6) Glossary		
MS_Word_PC_Driver_Fmt	57	Microsoft Word for PC (up to version 6) Driver		
MS_Word_PC_Misc_Fmt	58	Microsoft Word for PC (up to version 6) Miscellaneous File		
NBI_Async_Archive_Fmt	59	NBI Async Archive Format		
Navy_DIF_Fmt	60	Navy DIF (document interchange format)		ND
NBI_Net_Archive_Fmt	61	NBI Net Archive Format		NN
NIOS_TOP_Fmt	62	NIOS TOP		
FileMaker_Mac_Fmt	63	Filemaker MAC		FP5, FP7
ODA_Q1_11_Fmt	64	ODA / ODIF Q1 11		OD
ODA_Q1_12_Fmt	65	ODA / ODIF Q1 12		OD
OLIDIF_Fmt	66	OLIDIF (Olivetti)		
Office_Writer_Fmt	67	Office Writer		OW
PC_Paintbrush_Fmt	68	PC Paintbrush Graphics (PCX)	image/vnd.zbrush.pcx	PCX
CPT_Comm_Fmt	69	CPT Corporation word processor		PF
Lotus_PIC_Fmt	70	Lotus PIC	image/x-pict	PIC
Mac_PICT_Fmt	71	QuickDraw Picture	image/x-pict	PCT
Philips_Script_Word_Fmt	72	Philips Script		
PostScript_Fmt	73	PostScript	application/postscript	PS
PRIMEWORD_Fmt	74	PRIMEWORD		
Quadratron_Q_One_v1_Fmt	75	Q-One V1.93J		Q1, QX
Quadratron_Q_One_v2_Fmt	76	Q-One V2.0		Q1, QX
SAMNA_Word_IV_Fmt	77	SAMNA Word		SAM
Ami_Pro_Draw_Fmt	78	Lotus Ami Pro Draw		SDW

Format Name	Number	Description	MIME Type	Extension
SYLK_Spreadsheet_Fmt	79	SYmbolic LinK (SYLK) format		SLK
SmartWare_II_WP_Fmt	80	Informix SmartWare II word processor		DOC
Symphony_Fmt	81	Lotus Symphony spreadsheet		WR1
Targa_Fmt	82	Targa image	image/x-tga	TGA
TIFF_Fmt	83	Tag Image File Format (TIFF)	image/tiff	TIF, TIFF
Targon_Word_Fmt	84	Targon Word		TW
Uniplex_Ucalc_Fmt	85	Uniplex Ucalc		SS
Uniplex_WP_Fmt	86	Uniplex word processor		UP
MS_Word_UNIX_Fmt	87	Microsoft Word UNIX	application/msword	
WANG_PC_Fmt	88	WANG PC		
WordERA_Fmt	89	WordERA		DC, GL, FR
WANG_WPS_Comm_Fmt	90	WANG WPS		WF
WordPerfect_Mac_Fmt	91	WordPerfect MAC	application/x-corel-wordperfect	
WordPerfect_Fmt	92	WordPerfect version 4	application/x-corel-wordperfect	WP, WP4
WordPerfect_VAX_Fmt	93	WordPerfect VAX	application/x-corel-wordperfect	
WordPerfect_Macro_Fmt	94	WordPerfect Macro	application/vnd.wordperfect	MRS
WordPerfect_Dictionary_Fmt	95	WordPerfect Spelling Dictionary	application/vnd.wordperfect	SPW
WordPerfect_Thesaurus_Fmt	96	WordPerfect Thesaurus	application/vnd.wordperfect	
WordPerfect_Resource_Fmt	97	WordPerfect Resource File	application/vnd.wordperfect	WWK, PRS
WordPerfect_Driver_Fmt	98	WordPerfect Driver	application/vnd.wordperfect	IRS, VRS
WordPerfect_Cfg_Fmt	99	WordPerfect Configuration File	application/vnd.wordperfect	PFX
WordPerfect_Hyphenation_Fmt	100	WordPerfect Hyphenation Dictionary	application/vnd.wordperfect	HYC
WordPerfect_Misc_Fmt	101	WordPerfect Miscellaneous File	application/vnd.wordperfect	
WordMARC_Fmt	102	WordMARC Composer	video/x-ms-wm	WM, PW
Windows_Metafile_Fmt	103	Windows Metafile	image/wmf	WMF
Windows_Metafile_NoHdr_Fmt	104	Windows Metafile (no header)	image/wmf	WMF
SmartWare_II_DB_Fmt	105	Informix SmartWare II database		
WordPerfect_Graphics_Fmt	106	WordPerfect Graphics (version 2 and higher)	application/vnd.wordperfect	WPG, QPG

Format Name	Number	Description	MIME Type	Extension
WordStar_Fmt	107	WordStar		WS, WSD
WANG_WITA_Fmt	108	WANG WITA		WT
Xerox_860_Comm_Fmt	109	Xerox 860		
Xerox_Writer_Fmt	110	Xerox Writer		
DIF_SpreadSheet_Fmt	111	Data Interchange Format (DIF)	application/dif+xml	DIF
Enable_Spreadsheet_Fmt	112	Enable Spreadsheet	application/vnd.epson.ssf	SSF
SuperCalc_Fmt	113	Sorcim SuperCalc spreadsheet		CAL
UltraCalc_Fmt	114	UltraCalc spreadsheet		
SmartWare_II_SS_Fmt	115	Informix SmartWare II spreadsheet		
SOF_Encapsulation_Fmt	116	Serialized Object Format (SOF)	application/java-serialized-object	SOF
PowerPoint_Win_Fmt	117	Microsoft PowerPoint PC (up to version 4)	application/x-ms-powerpoint	PPT
PowerPoint_Mac_Fmt	118	Microsoft PowerPoint MAC (up to version 4)	application/x-ms-powerpoint	PPT
PowerPoint_95_Fmt	119	Microsoft PowerPoint 95	application/x-ms-powerpoint	PPT
PowerPoint_97_Fmt	120	Microsoft PowerPoint 97	application/x-ms-powerpoint	PPT
PageMaker_Mac_Fmt	121	PageMaker for Macintosh		
PageMaker_Win_Fmt	122	PageMaker for Windows		
MS_Works_Mac_WP_Fmt	123	Microsoft Works Word Processor for MAC	application/x-msworks	MWK
MS_Works_Mac_DB_Fmt	124	Microsoft Works Database for MAC	application/x-msworks	
MS_Works_Mac_SS_Fmt	125	Microsoft Works Spreadsheet for MAC	application/x-msworks	
MS_Works_Mac_Comm_Fmt	126	Microsoft Works Communication for MAC	application/x-msworks	
MS_Works_DOS_WP_Fmt	127	Microsoft Works Word Processor for DOS	application/x-msworks	WPS
MS_Works_DOS_DB_Fmt	128	Microsoft Works Database for DOS	application/x-msworks	WDB
MS_Works_DOS_SS_Fmt	129	Microsoft Works Spreadsheet for DOS	application/x-msworks	
MS_Works_Win_WP_Fmt	130	Microsoft Works Word Processor for Windows	application/x-msworks	WPS, W40
MS_Works_Win_DB_Fmt	131	Microsoft Works Database for Windows	application/x-msworks	
MS_Works_Win_SS_Fmt	132	Microsoft Works Spreadsheet for Windows	application/x-msworks	S30, S40
PC_Library_Fmt	133	DOS/Windows Object Library	application/x-archive	LIB, A
MacWrite_Fmt	134	MacWrite	application/macwriteii	

Format Name	Number	Description	MIME Type	Extension
MacWrite_II_Fmt	135	MacWrite II	application/macwriteii	
Freehand_Fmt	136	Freehand MAC	image/x-freehand	
Disk_Doubler_Fmt	137	Disk Doubler		
HP_GL_Fmt	138	HP Graphics Language	vector/x-hpgl	HPGL, HPG
FrameMaker_Fmt	139	FrameMaker	application/vnd.framemaker	FM, FRM

X10_Fmt	899	X10 Source Code[4]	text/x-x10	X10
XQuery_Fmt	900	XQuery Source Code[4]	text/xquery	XQM

Format Name	Number	Description	MIME Type	Extension
Xojo_Fmt	901	Xojo Source Code[4]		
Xtend_Fmt	902	Xtend Source Code[4]	text/x-xtend	XTEND
YANG_Fmt	903	YANG Source Code[4]		YANG
Zephir_Fmt	904	Zephir Source Code[4]		ZEP
eC_Fmt	905	eC Source Code[4]	text/x-ecsrc	EC
reStructuredText_Fmt	906	reStructuredText Source Code[4]	text/x-rst	
xBase_Fmt	907	xBase Source Code[4]		
Windows_Installer_Fmt	908	MSI Windows Installer format	application/x-ole-storage	MSI
Autodesk_3ds_Max_Fmt	909	Autodesk 3ds Max format		MAX
PhotoDraw_Mix_Fmt	910	PhotoDraw MIX image	image/vnd.mix	MIX
Softimage_SCN_Fmt	911	Softimage Scene SCN format		SCN
Parasolid_XT_Fmt	912	Parasolid ascii XT format		X_T
Parasolid_XB_Fmt	913	Parasolid binary XB format		X_B
IGES_Fmt	914	Initial Graphics Exchange Specification format	model/iges	IGS
ACE_Archive_Fmt	915	ACE archive format	application/x-ace-compressed	ACE
Grasshopper_GHX_Fmt	916	Grasshopper GHX format		GHX
MS_FrontPage_Macro_Fmt	917	Microsoft FrontPage macro file format		FPM
MS_AtWork_Fax_Fmt	918	Microsoft AtWork Fax format		AWD
MS_Image_Composer_Fmt	919	Microsoft Image Composer format		MIC
MS_Visual_InterDev_Fmt	920	Microsoft Visual InterDev web project items file		WDM
Macromedia_Flash_FLA_OLE_Fmt	921	Macromedia Flash FLA Project File OLE format		FLA
Corel_Draw_X4_Fmt	922	CorelDRAW version X4 onwards	application/x-vnd.corel.zcf.draw.document+zip	CDRX
Ogg_Daala_Fmt	923	Ogg Daala video format	video/daala	OGV
Ogg_BBC_Dirac_Fmt	924	Ogg BBC Dirac video format	video/x-dirac	OGV
PKCS_7_Fmt	925	PKCS #7 cryptographic format	application/pkcs7-signature	P7S
Time_Stamped_Data_Fmt	926	Time-stamped data format	application/timestamped-data	TSD
Sereal_Fmt	927	Sereal data serialization format	application/sereal	SRL
Associated_Signature_Simple_Fmt	928	Associated Signature Container Simple format	application/vnd.etsi.asic-s+zip	ASICS

Format Name	Number	Description	MIME Type	Extension
Associated_Signature_Extended_Fmt	929	Associated Signature Container Extended format	application/vnd.etsi.asic-e+zip	ASICE
iBooks_Fmt	930	Apple iBooks format	application/x-ibooks+zip	IBOOKS
PDF_Forms_Data_Fmt	931	PDF Forms Data Format	application/vnd.fdf	FDF
PDF_XML_Forms_Data_Fmt	932	PDF XML Forms Data Format	application/vnd.adobe.xfdf	XFDF
AxCrypt_Fmt	933	AxCrypt encrypted document	application/x-axcrypt	AXX
Unix_Archive_Fmt	934	Unix Archive ar format	application/x-archive	AR
Berkeley_Btree_Database_Fmt	935	Berkeley DB btree database format	application/x-berkeley-db	DB
Berkeley_Hash_Database_Fmt	936	Berkeley DB hash database format	application/x-berkeley-db	DB
Berkeley_Log_Database_Fmt	937	Berkeley DB log database format	application/x-berkeley-db	
Berkeley_Queue_Database_Fmt	938	Berkeley DB queue database format	application/x-berkeley-db	
BitTorrent_Fmt	939	BitTorrent file format	application/x-bittorrent	TORRENT
Chrome_Extension_Fmt	940	Google Chrome Extension format	application/x-chrome-package	CRX
Dalvik_Executable_Fmt	941	Dalvik Executable dex format	application/x-dex	DEX
Foxmail_Fmt	942	Foxmail email format	application/x-foxmail	BOX
GRIB_Fmt	943	General Regularly-distributed Information in Binary form GRIB format	application/x-grib	GRB, GRIB2
Zstandard_Fmt	944	Zstandard compression format	application/zstd	ZSTD
LZ4_Fmt	945	LZ4 compressed file	application/x-lz4	LZ4
MS_Money_Fmt	946	Microsoft Money format	application/x-msmoney	MNY
NetCDF_Fmt	947	Network Common Data Form NetCDF format	application/x-netcdf	NC
SAS6_Data_Fmt	948	SAS 6 Data storage format	application/x-sas-data-v6	SD2
SAS_Transport_Fmt	949	SAS Transport File XPORT format	application/x-sas-xport	XPT, XPORT
Snappy_Framed_Fmt	950	Snappy Framed compression format	application/x-snappy-framed	SZ
Stata_Data_Fmt	951	Stata Data Format	application/x-stata-dta	DTA
SPSS_SAV_Fmt	952	SPSS Statistics Data File Format		SAV
Zoo_Archive_Fmt	953	Zoo Compressed Archive Format	application/x-zoo	ZOO
CDX_Fmt	954	ChemDraw CDX format	chemical/x-cdx	CDX
CDXML_Fmt	955	ChemDraw CDXML format	application/vnd.chemdraw+xml	CDXML

Format Name	Number	Description	MIME Type	Extension
BPG_Fmt	956	Better Portable Graphics BPG format	image/x-bpg	BPG
Apple_Icon_Fmt	957	Apple Icon image format	image/icns	ICNS
NITF_Fmt	958	National Imagery Transmission Format NITF image	image/nitf	NTF, NITF
ERDAS_Imagine_Fmt	959	ERDAS Imagine image format	application/x-erdas-hfa	HFA, RRD, AUX
MS_Office_Temporary_Owner_Fmt	960	Microsoft Office temporary owner file	application/x-ms-owner	
EAC3_Audio_Fmt	961	Enhanced-AC3 (EAC3) Audio File format	audio/eac3	AC3
COFF_Relocatable_Fmt	962	Common Object File Format (COFF) relocatable object	application/x-object-file	O
COFF_Executable_Fmt	963	Common Object File Format (COFF) executable	application/x-executable-file	
COFF_Dynamic_Lib_Fmt	964	Common Object File Format (COFF) dynamic library	application/x-library-file	
ELF_Core_Fmt	965	ELF Core file	application/x-coredump	
Purify_Fmt	966	Rational Purify data file		PFY
Kryptel_Fmt	967	Kryptel encrypted file		EDC
Windows_Core_Dump_Fmt	968	Windows heap or mini core dump file	application/x-dmp	DMP
Qt_Prerendered_Font_Fmt	969	Qt Prerendered Font format		QPF2
AIX_Relocatable_Fmt	970	AIX/RISC COFF relocatable object	application/x-object-file	
AIX_Executable_Fmt	971	AIX/RISC COFF executable	application/x-executable-file	
AIX_Dynamic_Lib_Fmt	972	AIX/RISC COFF dynamic library	application/x-library-file	A
HPUX_Relocatable_Fmt	973	HPUX/PA-RISC COFF relocatable object	application/x-object-file	
HPUX_Executable_Fmt	974	HPUX/PA-RISC COFF executable	application/x-executable-file	
HPUX_Dynamic_Lib_Fmt	975	HPUX/PA-RISC COFF dynamic library	application/x-library-file	SL
XML_EBCDIC_Fmt	976	EBCDIC-encoded XML file	application/xml	XML
MPEG_JVT_H264_Fmt	977	MPEG JVT-NAL sequence H264 video	video/h264	264
Material_Exchange_Fmt	978	Material Exchange Format audio-video container format	application/mxf	MXF
MS_Agent_Character_Fmt	979	Microsoft Agent Character file		ACS
Quicken_Fmt	980	Quicken data file		QDF
MS_Outlook_Address_Fmt	981	Microsoft Outlook address file		WAB
MS_Answer_Wizard_Fmt	982	Microsoft Answer Wizard file		

Format Name	Number	Description	MIME Type	Extension
ADX_Fmt	983	ADX audio file		ADX
System_Deployment_Image_Fmt	984	Microsoft System Deployment Image SDI format		SDI
Free_Lossless_Image_Fmt	985	Free Lossless Image Format (FLIF)	image/flif	FLIF
DPX_Fmt	986	Digital Picture Exchange (DPX) image format	image/dpx	DPX
Avro_Fmt	987	Apache Avro binary format		AVRO
InstallShield_Archive_Fmt	988	InstallShield archive (early versions) format		EX_
Mac_Executable_Fmt	989	Mac OS-X (Mach-O) executable format		
GDSII_Fmt	990	GDSII data format		GDS
ActiveMime_Fmt	991	Microsoft ActiveMime (mso) documents	application/x-mso	MSO
SmartCharts_Fmt	992	BizInt SmartCharts data format		CHP, CHRR
Webex_ARF_Fmt	993	Webex advanced network ARF recordings		ARF
Webex_WRF_Fmt	994	Webex local WRF recordings		WRF
PGP_NetShare_Fmt	995	Symantec PGP NetShare encrypted file		
Ability_WP_OLE_Fmt	996	Ability Write later versions format		AWW
Ability_SS_OLE_Fmt	997	Ability Spreadsheet later versions format		AWS
InDesign_IDML_Fmt	998	Adobe InDesign IDML format	application/vnd.adobe.indesign-idml-package	IDML
Executable_JAR_Fmt	999	Executable Java Archive (jar) file	application/java-archive	JAR
IDOL_IDX_Fmt	1000	IDOL Server IDX file		IDX
Android_Package_Kit_Fmt	1001	Android Package Kit (APK) format	application/vnd.android.package-archive	APK
Android_Binary_XML_Fmt	1002	Android Binary XML (compressed by aapt) format	application/xml	XML
Java_WAR_Fmt	1003	Java WAR file format		WAR
Java_EAR_Fmt	1004	Java EAR file format		EAR
Atom_Syndication_Fmt	1005	Atom Syndication Format	application/atom+xml	ATOM
RSS_Fmt	1006	RSS syndication XML format	application/rss+xml	RSS
SMIL_Fmt	1007	Synchonized Multimedia Integration Language (SMIL) XML format	application/smil+xml	SMIL
XSLT_Fmt	1008	Extensible Stylesheet Language Transformations (XSLT) format	application/xslt+xml	XSL, XSLT
XML_Shareable_Playlist_Fmt	1009	XML Shareable Playlist Format (XSPF)	application/xspf+xml	XSPF

Format Name	Number	Description	MIME Type	Extension
FictionBook_Fmt	1010	FictionBook e-book XML format	application/x-fictionbook+xml	FB2
Adobe_Premiere_Project_Fmt	1011	Adobe Premiere project format	image/vnd.adobe.premiere	PPJ
RDF_XML_Fmt	1012	RDF/XML format	application/rdf+xml	RDF
Really_Simple_Discovery_Fmt	1013	Really Simple Discovery (RSD) XML format	application/rsd+xml	RSD
SBML_Fmt	1014	Systems Biology Markul Language (SBML) XML format	application/sbml+xml	SBML
SRU_Fmt	1015	Search/Retrieve via URL (SRU) XML format	application/sru+xml	SRU
SSML_Fmt	1016	Speech Synthesis Markup Language (SSML) XML format	application/ssml+xml	SSML
PLS_Fmt	1017	Pronunciation Lexicon Specification (PLS) XML format	application/pls+xml	PLS
TEI_Fmt	1018	Text Encoding Initiative (TEI) XML format	application/tei+xml	TEI
METS_Fmt	1019	Metadata Encoding and Transmission Standard (METS) XML format	application/mets+xml	METS
MODS_Fmt	1020	Metadata Object Description Schema (MODS) XML format	application/mods+xml	MODS
Metalink_Fmt	1021	Metalink XML format	application/metalink4+xml	METALINK
Open_eBook_Fmt	1022	Open eBook (OEBPS) XML format	application/oebps-package+xml	OPF
SRGS_Fmt	1023	Speech Recognition Grammar Specification (SRGS) XML format	application/srgs+xml	SRGS
SPARQL_Results_Fmt	1024	SPARQL Query Results XML format	application/sparql-results+xml	SRX
Adobe_XML_Data_Package_Fmt	1025	Adobe XML Data Package format	application/vnd.adobe.xdp+xml	XDP
ESzigno_Fmt	1026	e-Szigno signed xml document	application/vnd.eszigno3+xml	ES3
Mozilla_XUL_Fmt	1027	Mozilla XML User Interface Language (XUL) XML format	application/vnd.mozilla.xul+xml	XUL
SyncML_Fmt	1028	Synchronization Markup Language (SyncML) XML format	application/vnd.syncml+xml	XML
VoiceXML_Fmt	1029	VoiceXML (VXML) XML format	application/voicexml+xml	VXML
TI_Target_Configuration_Fmt	1030	Texas Instruments CCXML target configuration XML format		CCXML
LZFSE_Fmt	1031	Lempel-Ziv Finite State Entropy (LZFSE) compression format		LZFSE
Kindle_eBook_Fmt	1032	Amazon Kindle or Mobipocket eBook format	application/vnd.amazon.ebook	AZW, PRC
Oasis_Stream_Fmt	1033	Open Artwork System Interchange Standard (OASIS) format		OAS
Amazon_KFX_Fmt	1034	Amazon KFX eBook format		KFX
KTX_Fmt	1035	KTX image format	image/ktx	KTX
GMSH_Mesh_Fmt	1036	GMSH Mesh polygon format	model/mesh	MSH

Format Name	Number	Description	MIME Type	Extension
Collada_DAE_Fmt	1037	Collada Digital Asset Exchange (DAE) format	model/vnd.collada+xml	DAE
YIN_Fmt	1038	YIN XML format	application/yin+xml	YIN
MPEG_Playlist_Fmt	1039	MPEG audio playlist format	audio/mpegurl	M3U
Windows_Audio_Playlist_Fmt	1040	Windows Audio playlist format	audio/x-ms-wax	WAX
DTS_Audio_Fmt	1041	DTS Coherent Acoustics audio format	audio/vnd.dts	DTS
Chemical_Markup_Language_Fmt	1042	Chemical Markup Language (CML) XML format	chemical/x-cml	CML
CrystalMaker_Fmt	1043	CrystalMaker chemical format	chemical/x-cmdf	CMDF
VTK_XML_Fmt	1044	Visualization Toolkit VTK XML format	model/vnd.vtu	VTU
IPFIX_Fmt	1045	IP Flow Information Export (IPFIX) format	application/ipfix	IPFIX
Portable_Font_Resource_Fmt	1046	Portable Font Resource font format	application/font-tdpfr	PFR
MARC_Fmt	1047	Machine-Readable Cataloging (MARC21) format	application/marc	MARC
MARC_XML_Fmt	1048	Machine-Readable Cataloging (MARC) XML format	application/marcxml+xml	XML
XAR_Fmt	1049	Extensible Archive (XAR) format		
Symbian_Installer_Fmt	1050	Symbian installer format	application/vnd.symbian.install	SIS
SO_Drawing_XML_Fmt	1051	OpenDocument format (OpenOffice 1/StarOffice 6.7) Drawing XML	application/vnd.sun.xml.draw	SXD
SO_Text_Global_XML_Fmt	1052	OpenDocument format (OpenOffice 1/StarOffice 6.7) Writer Master document XML	application/vnd.sun.xml.writer.global	SXG
ODF_Chart_Fmt	1053	ODF Chart	application/vnd.oasis.opendocument.chart	ODC

ODF_Presentation_XML_Fmt	1069	ODF Presentation flat XML format	application/vnd.oasis.opendocument.presentation.xml	FODP
ODF_Spreadsheet_XML_Fmt	1070	ODF Spreadsheet flat XML format	application/vnd.oasis.opendocument.spreadsheet.xml	FODS
ODF_Text_XML_Fmt	1071	ODF Text flat XML format	application/vnd.oasis.opendocument.text.xml	FODT
ODF_Extension_Fmt	1072	ODF Extension format	application/vnd.openofficeorg.extension	OXT
StarView_Metafile_Fmt	1073	OpenOffice StarView MetaFile format	image/x-svm	SVM
BBeB_LRF_eBook_Fmt	1074	Broad Band eBook (BBeB) in LRF format		LRF
GPG_Trust_DB_Fmt	1075	GPG trust database format		GPG
VICE_Emulator_Fmt	1076	VICE (Versatile Commodore Emulator) format		VSF
Portable_Game_Notation_Fmt	1077	Portable Game Notation chess format	application/vnd.chess-pgn	PGN
Doom_WAD_Fmt	1078	Doom IWAD/PWAD format	application/x-doom	WAD
Device_Tree_Blob_Fmt	1079	Linux Device Tree Blob format		DTB
BDF_Font_Fmt	1080	Glyph Bitmap Distribution Format	application/x-font-bdf	BDF
PC_Screen_Font_Fmt	1081	PC Screen Font format	application/x-font-psf	PSF
JNLP_Fmt	1082	Java Network Launching Protocol	application/x-java-jnlp-file	JNLP
XAML_Browser_Application_Fmt	1083	XAML Browser Application (XBAP) format	application/x-ms-xbap	XBAP
MS_Binder_Fmt	1084	Microsoft Office Binder format	application/x-msbinder	OBP
XAP_Fmt	1085	Microsoft Silverlight application (XAP) format	application/x-silverlight-app	XAP
StuffIt_X_Fmt	1086	StuffIt X (SITX) archive format	application/x-stuffitx	SITX
FIG_Fmt	1087	Facility for Interactive Generation of figures (FIG) image format	application/x-xfig	FIG
XPInstall_Fmt	1088	XPInstall Cross-Platform Installer Module (XPI) format	application/x-xpinstall	XPI

Format Name	Number	Description	MIME Type	Extension
XDF_Fmt	1089	Extensible Data Format (XDF) XML format		XDF
MXML_Fmt	1090	MXML UI markup language XML format		MXML
MusicXML_Fmt	1091	MusicXML format	application/vnd.recordare.musicxml	MXL
Finale_Fmt	1092	Finale audio format		MUS
Spotfire_DXP_Fmt	1093	TIBCO Spotfire DXP data format	application/vnd.spotfire.dxp	DXP
MS_Office_Theme_2007_Fmt	1094	Microsoft Office theme format	application/vnd.ms-officetheme	THMX
Adobe_AIR_Installer_Fmt	1095	Adobe AIR application installer package	application/vnd.adobe.air-application-installer-package+zip	AIR
Flex_Project_Fmt	1096	Adobe Flash Flex project file format	application/vnd.adobe.fxp	FXP
FoxPro_Fmt	1097	FoxPro compiled source format		FXP
VST_Preset_Fmt	1098	Virtual Studio Technology (VST) preset format		FXP
Mischief_Image_Fmt	1099	Mischief vector graphics image format		ART
FreeArc_Fmt	1100	FreeArc archive format	application/x-freearc	ARC
Autodesk_3ds_Fmt	1101	Autodesk 3ds format	application/x-3ds	3DS
Monkeys_Audio_Fmt	1102	Monkey’s Audio format		APE
CALS_Fmt	1103	CALS raster image format		CAL
Dr_Halo_PAL_Fmt	1104	Dr Halo raster image PAL file format		PAL
DPG_Fmt	1105	Nintendo DS DPG video format		DPG
JPEG_XR_Fmt	1106	JPEG XR (extended range) image format	image/vnd.ms-photo	JXR, HDP
TCR_eBook_Fmt	1107	TCR (Text Compression for Reader) eBook format		TCR
IHEX_Fmt	1108	Intel Hex format		IHEX
QCOW_Fmt	1109	QEMU Copy On Write		QCOW
VDI_Fmt	1110	VirtualBox Disk Image		VDI
OneNote_Alternate_Fmt	1111	OneNote Alternative Packaging Format		
RMS_Protected_Fmt	1112	Rights Management Services (RMS)-protected format		PFILE, PPDF, PJPG, PTXT
Portfolio_PDF_Fmt	1113	Portfolio PDF File	application/pdf	PDF
Crystal_Reports_Fmt	1114	SAP Crystal Reports format	application/x-rpt	RPT
Thumbs_db_Fmt	1115	Microsoft Windows thumbs.db format		DB

Format Name	Number	Description	MIME Type	Extension
PagePlus_Fmt	1116	Serif PagePlus format		PPP
MS_Project_Exchange_Fmt	1117	Microsoft Project Exchange format		MPX
MS_Management_Pack_MPX_Fmt	1118	Microsoft Systems Center Operation Manager (SCOM) management pack MPX format		MPX
AutoCAD_VBA_Project_Fmt	1119	AutoCAD VBA project format		DVB
PLY_ASCII_Fmt	1120	Polygon File Format (PLY) ASCII format		PLY
PLY_Binary_Fmt	1121	Polygon File Format (PLY) binary format		PLY
JavaView_JVX_Fmt	1122	JavaView XML (JVX) format		JVX
X3D_Fmt	1123	Extensible 3d Graphics (X3D) XML format	model/x3d+xml	X3D
ZBrush_Project_Fmt	1124	ZBrush ZProject (ZPR) format		ZPR
ZBrush_Tool_Fmt	1125	ZBrush ZTtool (ZTL) format		ZTL
Windows_Installer_Patch_Fmt	1126	Microsoft Windows Installer Patch Package (MSP) format		MSP
Windows_Installer_Transform_Fmt	1127	Microsoft Windows Installer Transform (MST) format		MST
Lotus_Approach_Fmt	1128	Lotus Approach format	application/vnd.lotus-approach	APR, MPR
Outlook_SendRcv_Settings_Fmt	1129	Microsoft Outlook 2002 Send-Receive Settings		SRS
MS_Publisher_Scheme_Fmt	1130	Microsoft Publisher colour scheme		SCM
SO_Chart_Fmt	1131	Star Office 4,5 Chart	application/vnd.stardivision.chart	SDS
SO_Database_Fmt	1132	Star Office 4,5 Database	application/vnd.stardivision.base	SDB
SO_Library_Fmt	1133	Star Office 4,5 Library		SBL
PageMaker_Document_Fmt	1134	Adobe PageMaker document	application/pagemaker	PMD
MS_DTS_Fmt	1135	Microsoft Data Transformation Services (DTS) package file		DTS
Cognos_PowerPlay_PPR_Fmt	1136	Cognos PowerPlay up to version 7 (PPR) format		PPR
Visual_Studio_SUO_Fmt	1137	Microsoft Visual Studio solution user options (suo) file		SUO
MS_GraphEdit_Fmt	1138	Microsoft GraphEdit File format		GRF
ArcGIS_Graph_Fmt	1139	ArcGIS Graph format		GRF
SID_Audio_Fmt	1140	SID Audio format	audio/prs.sid	SID
MrSID_Fmt	1141	LizardTech MrSID image format	image/x-mrsid	SID
Cardfile_Fmt	1142	Microsoft Windows Cardfile address book format	application/x-mscardfile	CRD

Format Name	Number	Description	MIME Type	Extension
MS_Word_Mac_4_Fmt	1143	Microsoft Word for Macintosh (version 4,5)	application/msword	DOC
WordPerfect_5_Fmt	1144	WordPerfect (version 5)	application/x-corel-wordperfect	WOP, DOC
WordPerfect_6_Fmt	1145	WordPerfect (version 6 and higher)	application/x-corel-wordperfect	WPD
WordPerfect_Graphics_1_Fmt	1146	WordPerfect Graphics (version 1)	application/vnd.wordperfect	WPG, QPG
Organization_Chart_Fmt	1147	OrgPlus Organization Chart	application/orgplus	OPX
Lotus_Organizer_Fmt	1148	Lotus Organizer documents	application/vnd.lotus-organizer	OR2, OR3, OR4, OR5, OR6
MS_DBML_Fmt	1149	Microsoft Database Markup Language XML document		DBML
XMind_Fmt	1150	XMind document	application/xmind	XMIND
MSI_Cerius_Fmt	1151	MSI Cerius chemical formula document	chemical/x-cerius	MSI
GenBank_Fmt	1152	GenBank DNA character sequence document	chemical/x-genbank	GB
GIS_World_File_Fmt	1153	ESRI GIS World file		BPW, GFW, JGW, J2W, PGW, SDW, TFW, WLD
GIS_Projection_Metadata_Fmt	1154	ESRI Projection Metadata (PRJ) file		PRJ
PowerWorld_Binary_Fmt	1155	PowerWorld Binary (PWB) file		PWB
PowerWorld_Display_Fmt	1156	PowerWorld Display (PWD) file		PWD
ArcXML_Fmt	1157	ESRI ArcIMS project XML file (ArcXML)		AXL
GAMS_GDX_Fmt	1158	General Algebraic Modeling System (GAMS) Data Exchange (GDX) format		GDX
ArcMap_MXD_Fmt	1159	ArcMap Map Exchange Document project (MXD)		MXD
RRDtool_Fmt	1160	RRDtool (Round Robin Database) data file		RRD
HWPX_Fmt	1161	Hangul HWPX document	application/hwp+zip	HWPX
SolidWorks_2015_Fmt	1162	SolidWorks (2015 onwards) file		SLDPRT, SLDDRW, SLDASM
MS_Photo_Editor_Fmt	1163	Microsoft Photo Editor ‘embedded GIF’ file	application/vnd.ms-photo-editor	
MS_Word_HTML_Fmt	1164	Microsoft Word HTML format		DOC, HTM
MS_Excel_HTML_Fmt	1165	Microsoft Excel HTML format		XLS, HTM

Format Name	Number	Description	MIME Type	Extension
Portable_FloatMap_Fmt	1166	Portable FloatMap (PFM) image	image/x-portable-floatmap	PFM
RGBE_Fmt	1167	Radiance RGBE (HDR) image	image/vnd.radiance	HDR, PIC, RGBE, XYZE
APNG_Fmt	1168	Animated Portable Network Graphics (Animated-PNG)	image/apng	APNG, PNG
Enhanced_Compressed_Wavelet_Fmt	1169	Enhanced Compressed Wavelet image	image/ecw	ECW
Ensoniq_Waveset_Fmt	1170	Ensoniq Waveset audio data file		ECW
Corel_Photo_Paint_Fmt	1171	Corel Photo Paint (version 7 and higher)	image/x-corelphotopaint	CPT
OpenRaster_Fmt	1172	OpenRaster image	image/openraster	ORA
Krita_Fmt	1173	Krita image	application/x-krita	KRA
Gerber_Fmt	1174	Gerber image format	application/vnd.gerber	GBR
PGML_Fmt	1175	Precision Graphics Markup Language		PGML
Away3D_Fmt	1176	Away3D scene file		AWD
CAD_3MF_Fmt	1177	3D Manufacturing Format document	application/vnd.ms-package.3dmanufacturing-3dmodel+xml	3MF
AMF_Fmt	1178	Additive manufacturing file format (AMF) document	application/x-amf	AMF
C3D_Fmt	1179	Coordinate 3D (C3D) format		C3D
CAD_3DSystems_BFF_Fmt	1180	3D Sprint (3D Systems) SLA Build file		BFF
NRRD_Fmt	1181	NRRD (nearly raw raster data) image format		NRRD
Cinema_4D_Fmt	1182	Cinema 4D model		C4D
FBX_ASCII_Fmt	1183	Kaydara FBX project (ASCII)		FBX
FBX_Binary_Fmt	1184	Kaydara FBX project (binary)		FBX
Wavefront_OBJ_Fmt	1185	Wavefront OBJ geometry definition file		OBJ
Wavefront_MTL_Fmt	1186	Wavefront Material Template Library (MTL)		MTL

PaintShop_Pro_JBF_Fmt	1247	PaintShop Pro JBF image cache file	image/jbf	JBF
Delphi_Diagram_Portfolio_Fmt	1248	Delphi Diagram Portfolio file		DDP

[1]MHT, EML, and MBX files might return either format 2, 233, or 395, depending on the text in the file. In general, files that contain fields such as **To**, **From**, **Date**, or **Subject** are considered to be email messages; files that contain fields such as **content-type** and **mime-version** are considered to be MHT files; and files that do not contain any of those fields are considered to be text files.

[2]All CAT file extensions, for example CATDrawing, CATProduct, CATPart, and so on.

[3]This format is returned only if you enable source code identification.

[4]This format is returned only if you enable extended source code identification.

Appendix C: Document Fields

This appendix describes the standard fields that Connectors and CFS add to documents before the documents are indexed into IDOL Server.

Document Fields

The following fields are added to a document by connectors:

Field	Description
AUTN_IDENTIFIER	An identifier that allows a connector to extract the document from the repository again, for example during the collect or view actions. For more information about the identifier, see AUTN_IDENTIFIER, on page 206.
DocTrackingId	An identifier used for document tracking functionality.
DREREFERENCE	A reference for the document. This is the standard IDOL reference field, which is used for deduplication.
source_connector_run_id	(Added only when IngestSourceConnectorFields=TRUE). The asynchronous action token of the fetch action that ingested the document.
source_connector_server_id	(Added only when IngestSourceConnectorFields=TRUE). A token that identifies the instance of the connector that retrieved the document (different installations of the same connector populate this field with different IDs). You can retrieve the UID of a connector through action=GetVersion.

The following fields are added to a document during ingestion:

Field	Description
DocumentAttributes	KeyView document attributes.
DocumentClass	The KeyView document class.

Field	Description
DocumentSize	The size of the document.
DocumentType	A number that represents the program that created the file format.
DRECHILDCOUNT	The number of sub-files that the document contains.
DREDBNAME	The name of the IDOL database that the document must be indexed to.
DREFILENAME	The file name of the original document.
DREORIGINALNAME	The original file name passed to CFS. This is the full path for extracted sub-files.
DREROOTFAMILYREFERENCE	The parent document for the family of documents.
DREROOTFAMILYREFERENCE_ID	A unique hash for the family of documents.
FAMILYSORT	A field used to track families (that is, containers) of documents. It contains a hash unique to the family, with indices appended that describe the depth and number of attachments.
ImportErrorDescription	If an error occurs when a document is processed, a description of the error is written to this field.
ImportMagicExtension	The file extension of the detected document type.
ImportOriginalEncoding	The detected encoding used by the document.
ImportVersion	Internal version number.
InfoFlag	A KeyView Flag that describes the file type (External, Embedded and so on). 0 = default 1 = This sub file needs further extraction 2 = This sub file is protected 4 = This sub file is an external file 8 = This sub file is a mail item attachment 16 = This sub file is SMIME protected
KeyviewVersion	The version of KeyView that CFS was released with.
UUID	A unique identifier for the document.
VersionNumber	The version of CFS that was used to import the document.

AUTN_IDENTIFIER

An *Identifier* is a base-64 encoded string that identifies the source of a document in IDOL Server. When you use a connector to index documents into IDOL Server, an identifier is added to every document, in the `AUTN_IDENTIFIER` document field.

A connector can use the identifier to extract the original file from the repository. An application might need to extract the original file when presenting the results of a query. The application can request the file by sending a `collect` or `view` action to the connector.

The exact content of the `AUTN_IDENTIFIER` field depends on the connector that retrieved the document, but contains information such as:

- The document reference. The document reference identifies an item in a repository. For the files retrieved from the same repository, a reference is unique. For files retrieved by a File System Connector, the document reference is the path to the file. For e-mail messages retrieved by an Exchange Connector, the document reference includes the name of the message store and folder that contains the message.
- Additional information used to find the document in the repository. Though the document reference identifies a file in the repository, it might not provide sufficient information to retrieve it efficiently. The identifier can include additional information to assist the connector locate the document.
- The name of the fetch task that was used to retrieve the document. When a connector needs to retrieve a file, it can use the same settings by finding the fetch task in its configuration file.

An example identifier appears below:

```
<id section="MyTask1" reference="http://myserver:4567/doc/_vxswdfguhjknbio_
earycqzt_">
  <param name="SERVICEURL" value="http://myserver:4567/service"/>
  <param name="DOCID">_vxswdfguhjknbio_earycqzt_</param>
</id>
```

Sub File Indexes

Documents in IDOL Server can represent sub-files. In these documents, the `AUTN_IDENTIFIER` field contains the identifier of the container file.

To retrieve a sub-file from a repository, a connector must retrieve the container file and send it to KeyView so that the sub-file can be extracted. So that KeyView can extract the correct sub-file, the identifier must include a sub-file index.

When CFS indexes documents into IDOL Server, sub-file indexes are automatically written to the `SubFileIndexCSV` document field. For example:

```
SubFileIndexCSV="1"
```

> **NOTE:** Your connector must be configured with `EnableExtraction=true`. The connector's

> `KeyviewDirectory` parameter must also be set.

The sub-file index in this example (`1`) indicates that the document represents the second file in the container (the sub-files are indexed from 0).

Container files can contain other container files (for example an e-mail message file could contain ZIP file attachments, containing further sub-files). In this case, the sub-file index might include more than one level:

```
SubFileIndexCSV="2,6"
```

A sub-file index of `2,6` indicates that the document represents the seventh file in the third container, in the original container file.

When an action is sent to a connector to retrieve sub-files, the sub-file index must be appended to the identifier of the container. For example:

```
PGlkIHM9Ik15VGFzazEiIHI9Imh0dHA6Ly9teXNlcnZlcjo0NTY3L2RvYy9fdnhzd
2RmZ3VoamtuYmlvX2VhcnljcXp0XyI+PHAgbj0iU0VSVklDRVVSTCIgdj0iaHR0cD
ovL215c2VydmVyOjQ1Njcvc2VydmljZSIvPjxwIG49IkRPQ0lEIiB2PSJfdnhzd2R
mZ3VoamtuYmlvX2VhcnljcXp0XyIvPjwvaWQ+|2.6
```

> **NOTE:** Where sub-file indexes have multiple levels (for example `SubFileIndexCSV="2,6"`, the comma must be replaced by a period).

Append Sub File Indexes to the Document Identifier

You can configure CFS to automatically append sub-file indexes to document identifiers, before the documents are indexed into IDOL Server.

To do this, use the lua script `identifiers.lua`, which is included with CFS in the `scripts` folder. The script is also included below:

```
function handler( document )
   identifier = document:getFieldValue( "AUTN_IDENTIFIER" )

   if identifier then
      indices = document:getFieldValue( "SubFileIndexCSV" )

      if indices then
         indices = string.gsub(indices, ",", ".")
         document:setFieldValue("AUTN_IDENTIFIER", identifier .. "|" .. indices)
      end
   end

   return true
end
```

You must run the script after KeyView has extracted sub-files, so run the script using a *Post* Import task. For example:

```
[ImportTasks]
Post0=Lua:scripts/identifiers.lua
```

Glossary

A

ACI (Autonomy Content Infrastructure)
A technology layer that automates operations on unstructured information for cross-enterprise applications. ACI enables an automated and compatible business-to-business, peer-to-peer infrastructure. The ACI allows enterprise applications to understand and process content that exists in unstructured formats, such as email, Web pages, Microsoft Office documents, and IBM Notes.

ACI Server
A server component that runs on the Autonomy Content Infrastructure (ACI).

ACL (access control list)
An ACL is metadata associated with a document that defines which users and groups are permitted to access the document.

action
A request sent to an ACI server.

active directory
A domain controller for the Microsoft Windows operating system, which uses LDAP to authenticate users and computers on a network.

C

Category component
The IDOL Server component that manages categorization and clustering.

Community component
The IDOL Server component that manages users and communities.

connector
An IDOL component (for example File System Connector) that retrieves information from a local or remote repository (for example, a file system, database, or Web site).

Connector Framework Server (CFS)
Connector Framework Server processes the information that is retrieved by connectors. Connector Framework Server uses KeyView to extract document content and metadata from over 1,000 different file types. When the information has been processed, it is sent to an IDOL Server or Distributed Index Handler (DIH).

Content component
The IDOL Server component that manages the data index and performs most of the search and retrieval operations from the index.

D

DAH (Distributed Action Handler)
DAH distributes actions to multiple copies of IDOL Server or a component. It allows you to use failover, load balancing, or distributed content.

DIH (Distributed Index Handler)
DIH allows you to efficiently split and index extremely large quantities of data into multiple copies of IDOL Server or the Content component. DIH allows you to create a scalable solution that delivers high performance and high availability. It provides a flexible way to batch, route, and categorize the indexing of internal and external content into IDOL Server.

I

IDOL
The Intelligent Data Operating Layer (IDOL) Server, which integrates unstructured, semi-structured and structured information from multiple repositories through an understanding of the content. It delivers a real-time environment in which operations across applications and content are automated.

IDOL Proxy component
An IDOL Server component that accepts incoming actions and distributes them to the appropriate subcomponent. IDOL Proxy also performs some maintenance operations to make sure that the subcomponents are running, and to start and stop them when necessary.

Intellectual Asset Protection System (IAS)
An integrated security solution to protect your data. At the front end, authentication checks that users are allowed to access the system that contains the result data. At the back end, entitlement checking and authentication combine to ensure that query results contain only documents that the user is allowed to see, from repositories that the user has permission to access. For more information, refer to the IDOL Document Security Administration Guide.

K

KeyView
The IDOL component that extracts data, including text, metadata, and subfiles from over 1,000 different file types. KeyView can also convert documents to HTML format for viewing in a Web browser.

L

LDAP
Lightweight Directory Access Protocol. Applications can use LDAP to retrieve information from a server. LDAP is used for directory services (such as corporate email and telephone directories) and user authentication. See also: active directory, primary domain controller.

License Server
License Server enables you to license and run multiple IDOL solutions. You must have a License Server on a machine with a known, static IP address.

O

OmniGroupServer (OGS)
A server that manages access permissions for your users. It communicates with your repositories and IDOL Server to apply access permissions to documents.

P

primary domain controller
A server computer in a Microsoft Windows domain that controls various computer resources. See also: active directory, LDAP.

V

View
An IDOL component that converts files in a repository to HTML formats for viewing in a Web browser.

W

Wildcard
A character that stands in for any character or group of characters in a query.

X

XML
Extensible Markup Language. XML is a language that defines the different attributes of document content in a format that can be read by humans and machines. In IDOL Server, you can index documents in XML format. IDOL Server also returns action responses in XML format.

Send documentation feedback

If you have comments about this document, you can contact the documentation team by email. If an email client is configured on this system, click the link above and an email window opens with the following information in the subject line:

Feedback on Administration Guide (Micro Focus Connector Framework Server 12.4)

Add your feedback to the email and click **Send**.

If no email client is available, copy the information above to a new message in a web mail client, and send your feedback to swpdl.idoldocsfeedback@microfocus.com.

We appreciate your feedback!
