About This Guide

This manual provides you information about administering SecureLogin.

Additional Documentation

For the latest version of SecureLogin guides, see the [SecureLogin Documentation](#) portal.

Contact Information

We want to hear your comments and suggestions about this book and the other documentation included with this product. You can use the [comment on this topic](#) link at the bottom of each page of the online documentation, or send an email to Documentation-Feedback@microfocus.com.

For specific product issues, contact Micro Focus Customer Care at <https://www.microfocus.com/support-and-services/>.

1 Getting Started

NetIQ SecureLogin is an enterprise single sign-on product. It provides authentication solutions to web, Windows, host, and legacy application-based single sign-on. It functions as an identity overseer for all the systems that users access.

It is a credential management tool developed to increase an organization's network security and reduces support costs. It securely manages and encrypts the authentication information in a directory. It stores user names and passwords and automatically retrieves them for users when required.

- ◆ [Section 1.1, "Recommendations," on page 13](#)
- ◆ [Section 1.2, "Administrative Management Utilities," on page 13](#)
- ◆ [Section 1.3, "Additional Information," on page 14](#)

1.1 Recommendations

A thorough understanding of the following subjects is required to configure and administer SecureLogin:

- ◆ Microsoft Active Directory
- ◆ Microsoft Management Console (MMC)
- ◆ Microsoft Group Policy Object Management Console (GPMC)
- ◆ Microsoft Windows operating systems
- ◆ Lightweight Directory Access Protocol (LDAP)

1.2 Administrative Management Utilities

IMPORTANT: The NetIQ iManager product is discontinued and reached end-of-life. Therefore, SecureLogin has stopped the iManager support. If eDirectory is deployed as part of OES deployment, refer to the OES support cycle of iManager.

It is recommended to use SLManger in place of iManager for administering SecureLogin. Limitations of SLManger over iManager: SLManger does not support concurrent connections and configured groups.

For any references of iManager on previous versions of NetIQ SecureLogin, see [NetIQ SecureLogin 8.8 Documentation](#).

In this Section

- ◆ [Section 1.2.1, "SLManager," on page 14](#)
- ◆ [Section 1.2.2, "Microsoft Management Console Snap-In," on page 14](#)

1.2.1 SLManager

You can use SecureLogin Manager (SLManager) for any LDAP deployments, such as AD and eDirectory.

Starting SLManager

- 1 On the Start menu, select **Programs > NetIQ SecureLogin > SecureLogin Manager**. The Administrative Management utility is displayed.

NOTE: To use SLManager, Administrative Tools must be installed. Select the Administrative Tools option from the custom setup screen during the installation. If Administrative Tools is not installed, use the Modify option from the installer to install it and start SLManager.

- 2 In **Object**, specify your object name, then press the Enter key.

You must press the Enter key to submit the entry typed in **Object**. Clicking **OK** closes the dialog box, but does not accept the entry you typed. The object name must be in the LDAP convention (username, objectname) if you are using the LDAP mode and in the eDirectory convention (username.objectname) if you are using the eDirectory mode.

1.2.2 Microsoft Management Console Snap-In

Use the Microsoft Management Console (MMC) snap-in for Active Directory deployments.

On the Windows **Start** menu, select **Programs > Administrative Tools > Active Directory Users and Computers**. MMC is displayed.

1.3 Additional Information

- ♦ [Enforcing Users to Change Passwords Before the Grace Login Expires](#)
- ♦ [Support for Oracle Forms](#)
- ♦ [Notifications for Single Sign-On Applications](#)
- ♦ [Indication for an Active SecureLogin User](#)
- ♦ [Keyboard Shortcuts](#)

1.3.1 Enforcing Users to Change Passwords Before the Grace Login Expires

SecureLogin allows administrators to enforce users to change their password before the grace login expires.

For example, SecureLogin is installed in the LDAP mode with eDirectory. When the password expires, the authentication process consumes all the grace logins and users cannot log in. To avoid this, create the following registry keys:

- ♦ `GraceDaysBeforePasswordExpire` registry of DWORD value. This displays a warning message to the users about the number of days remaining for password expiry.
- ♦ `DaysForcePasswordChange` of DWORD value. This forces the users to change their passwords. Although the grace login available, this forces the users to change their password before the grace login expires.

For example, if the password policy is set to change every 90 days, the `GraceDaysBeforePasswordExpire` can be set to 5 and `DaysForcePasswordChange` can be set to 3. On the day 85 when users logs in, a message indicating the number of days left before password expiry appears. Users can choose to change the password immediately or change it later.

Similarly, when a users logs in on day 87 another message appears that forces the users to change the password. They cannot continue without changing the password.

NOTE: It is recommended to keep the grace login value greater than 2 as SecureLogin utilizes one grace login count for every connection with the directory.

1.3.2 Support for Oracle Forms

SecureLogin supports single sign-on to Oracle Forms that uses Java 1.7 or 1.8. If any of these Java components is added in the machine after installing (or upgrading to) SecureLogin, you need to enable SecureLogin to use the newly added Java component. To enable support to the new Java component, run the repair option of the SecureLogin installer.

1.3.3 Notifications for Single Sign-On Applications

When you launch any application that is available for single sign-on, SecureLogin displays a notification in the system tray indicating that the application can be selected for single sign-on. If you do not want to single sign-on to an application when it is launched then, you can ignore the notification and proceed. When you ignore the notification, the color of the icon changes from blue to orange indicating that web pages are available for single sign-on. You can view the list of web pages by clicking the icon on the system tray and selecting the application to single sign-on.

1.3.4 Indication for an Active SecureLogin User

You can identify the active SecureLogin user with the help of the visual cue in the task bar. This visual cue displays the details of the active user such as First name, Last name, Full name, Distinguished name, or Default name based on the preference settings. To modify these preferences, see [Display](#)

[user name on task bar](#). These preferences are refreshed every 30 seconds by default. You can also modify the refresh time interval by modifying the value of the registry key `UserbarRefreshInterval`.

In addition, you can add prefix to the user name displayed in the task bar. To add prefix, you must set the prefix text as a value for the registry key `UserbarPrefix`. These registry settings are available at `HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin`.

SecureLogin does not display the logged in user name by default in the task bar. For user name to be displayed in the task bar, you must right-click the SecureLogin icon on the notification area (system tray) and select `Show User bar` or you can right-click the task bar and select `Toolbars > SecureLogin SSO User`.

1.3.5 Keyboard Shortcuts

You can use the keyboard shortcuts to navigate to the required options.

| Key combination | Result |
|-----------------|---|
| Ctrl+Shift+A | Launches the New Application window. |
| Ctrl+L | Launches the Create Login window. |
| Ctrl+P | Launches the New password policy window |
| Delete | Deletes the selected application, login, and password policy. |

2 Configuration Tasks Before Deploying SecureLogin

The names of user IDs, applications, and password policies must be unique. You cannot create an application named Error.

Before you deploy SecureLogin, you must complete the following configuration tasks:

- ◆ [Section 2.1, “Setting User Preferences,” on page 17](#)
- ◆ [Section 2.2, “Disabling User Access,” on page 17](#)
- ◆ [Section 2.3, “Updating the Datastore Objects,” on page 18](#)
- ◆ [Section 2.4, “Changing the Organizational Unit Level Datastore,” on page 18](#)
- ◆ [Section 2.5, “Changing the Directory Datastore,” on page 19](#)
- ◆ [Section 2.6, “Deleting or Re-setting User Data,” on page 20](#)

2.1 Setting User Preferences

You can set the user preferences in the Preferences page for any of the administrative management utilities. Each user preference has a default value that is implemented until an alternative value is set. In directory hierarchies, the preference values are inherited from higher level objects. However, the preference values set at the user object level override any values inherited from other objects in the directory.

You can restrict users from setting or modifying the preferences.

2.1.1 Changing a Preference Value

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Preference**.
- 3 Locate the setting you want to change and specify the appropriate value in the **Value** column.
- 4 Click **OK**.

2.2 Disabling User Access

By default, a user has permission to change application definitions and predefined applications, passwords, and functionality. You do this through the administrative management utilities.

Several options are available for restricting user access by setting preferences at the user, group policy, container, or organizational unit level. This includes:

- ◆ Full access to all administrative tools.
- ◆ Access to selected administrative tools.

- ◆ Hiding the SecureLogin icon on the notification area (system tray).
- ◆ Hiding and password protecting the SecureLogin icon in the notification area (system tray).

If the SecureLogin icon is password protected, anyone attempting to access the SecureLogin Client Utility through the SecureLogin icon is prompted to provide the network password. This prevents non-authorized users from viewing SecureLogin data. However, an authorized user can use the administration tools to modify SecureLogin.

2.3 Updating the Datastore Objects

The SecureLogin datastore includes a range of security features, including storing the single sign-on credentials on the user's smart card, encrypting the datastore by using the Public Key Infrastructure (PKI)-based credentials and the Advanced Encryption Standard (AES) encryption algorithm support.

The SecureLogin datastore version 6.0, or later client can read data from the 3.x version of the datastore. However, the older versions of SecureLogin cannot read the data from the 6.0 and later versions of the datastore. In case of a mixed corporate environment in which some workstations are running SecureLogin 8.5, and the other workstations are running previous versions of SecureLogin, when a user moves between different versions of SecureLogin on different workstations the data gets incompatible. This is particularly a problem in Citrix environments or in large enterprise deployments.

If the SecureLogin datastore version 3.x is present when you install SecureLogin 8.5 then, SecureLogin detects 3.x data and continues to function correctly.

If you require the new functions, complete the following processes:

1. Choose a section of the tree to upgrade.

For example:

- ◆ Container
- ◆ Group
- ◆ Organization
- ◆ User

2. Make sure that all user workstations in that section of the tree are upgraded with the latest SecureLogin client.

The next time users log in, their data is converted to the latest version format and the new functions will be available.

2.4 Changing the Organizational Unit Level Datastore

In this Section

- ◆ [Changing the Organizational Unit Level Datastore in an Active Directory Environment](#)
- ◆ [Deploying an Upgrade](#)

2.4.1 Changing the Organizational Unit Level Datastore in an Active Directory Environment

Perform the following to set the directory datastore version at the organizational unit level in an Active Directory environment:

- 1 **On Microsoft Windows Server or Client:** On the Windows Start icon, select **Windows Administrative Tools > Active Directory Users and Computers**.
- 2 Right-click the required group policy, container, or OU, then click **Properties**.
- 3 Click the **SecureLogin** tab. The SecureLogin page is displayed.
- 4 Click **Manage**.
- 5 On the left pane, click **Advanced Settings**.
- 6 Click the **Datastore** tab.
- 7 From the **Select version drop-down** list, select the required version. A warning is displayed.

The warning message refers to 3.0 clients that were used by some users who later upgraded the datastore mode to version 7.0.

When a user's directory data version is upgraded, the datastore information displayed in the SecureLogin About box is not updated. To update this information, the user must activate Refresh Cache from the Advanced menu of the SecureLogin icon on the notification area (system tray).

2.4.2 Deploying an Upgrade

When you are deploying an upgrade across a series of workstations, follow the procedure explained in [Section 2.5, "Changing the Directory Datastore," on page 19](#). The next time when the directory server and the workstation caches are synchronized and SecureLogin operates in the new version mode.

2.5 Changing the Directory Datastore

When the directory is upgraded, the new features of SecureLogin are not available on the workstation. So, users must upgrade to the new version.

You can configure directory datastore version at the group policy, user object, container, or organizational unit levels. Set the datastore version at the container or the organization unit levels. This helps enterprises to manage the datastore base and minimize the possibility of conflicting versions.

If you require to update a single new feature of SecureLogin preference that requires 7.0 datastore, you are prompted with a warning before proceeding to change. For example, when you upgrade the **Use AES for SSO data encryption** preference.

2.6 Deleting or Re-setting User Data

If a user forgets the network password and passphrase answer (if the passphrase system is enabled), or if the login credential data has got corrupt, you can delete all the SecureLogin information for that user.

You as an administrator must do this because the user does not have access to the administrative management utilities.

Before you delete a user's datastore object, consider the following important aspects:

| User Data Re-set Option | Action |
|--|---|
| Select the required directory object only | The Delete single sign-on configuration for this datastore object option is available at the container, group policy, ou, and user object level. |
| Record (external to SecureLogin) all usernames, password, and additional required credential information | For example, if you delete a single sign-on-enabled application at the ou level, you might also be deleting the credentials for all users that reside in that container. |
| Delete the local cache on the workstation | <p>The object or user continues to inherit configuration from higher-level objects in the directory even though you deleted the user data in the directory cache.</p> <p>This means that you should delete the local cache on the workstation first. This ensures that it does not synchronize with the directory cache and re-create the configuration in the directory.</p> |

To reset the user data:

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Delete** in the Datastore section. A warning message appears.
- 3 Click **Yes**. The Datastore object is deleted.

If you did not delete the SecureLogin cache from the local cache, before you deleted the Datastore object data, you get an error message.

NOTE: When SecureLogin is installed in the SecretStore environment, the data will not be deleted from the SecretStore datastore.

- 4 Click **Yes**.

When you do this, you delete the complete data of the user, including:

- ◆ Credentials including usernames and passwords
- ◆ Application definitions
- ◆ Predefined applications
- ◆ Password policies
- ◆ Preferences
- ◆ Passphrase questions and answers

WARNING: The deleted data cannot be retrieved.

The next time the user logs in, the user is asked to set up a new passphrase question and response and re-enter the credentials for each application enabled for single sign-on.

SecureLogin supports setting a cache expiry by using the following registry entry on the client:

```
HKEY_LOCAL_MACHINE/SOFTWARE/Protocom/SecureLogin
```

```
DWORD Value CacheExpiryDays
```

The value data is the number of days. Do not provide zero (0) because the cache would expire immediately on refresh. The cache expiry period is updated at each cache or directory synchronization, or each time SecureLogin loads in an online mode.

NOTE: No warning is provided at cache expiry. If a cache is expired, the users cannot access SecureLogin in an offline mode until they log in, and create the cache again in an online session.

3 Managing Preferences

SecureLogin preferences are tools, options, and parameters used by the enterprise administrators to configure the user's SecureLogin corporate environment. You can restrict a user's access to SecureLogin preferences through administrative management utilities.

Preferences also include applications that are permitted to be enabled for single sign-on and the tools to enable users to access their own SecureLogin management and administration functions.

You can configure user preferences in the Preference properties table using administrative management utilities.

In this Chapter

- ♦ [Changing Rights for Installing JREs](#)
- ♦ [Preferences Categories](#)
- ♦ [Default Preference Values](#)
- ♦ [Setting User Preferences](#)
- ♦ [Setting the Preferences](#)
- ♦ [Configuring the Exclude.ini File](#)

3.1 Changing Rights for Installing JREs

SecureLogin checks for new JREs installed on the client when SecureLogin is launched. If new JREs are detected and they are allowed by user's permissions, the new JREs are enabled for single-sign on automatically, without any user prompts or intervention.

The JRE update process requires local administrative rights on the client. If the user is not logged in with administrative rights, the update fails without displaying any notification to the user.

The JREs are updated the next time the user logs in with administrative rights and launches SecureLogin on the workstation.

3.2 Preferences Categories

SecureLogin preferences are divided into the following categories:

- ♦ **.Net**
- ♦ **Auditing**
- ♦ **General**
- ♦ **Java**
- ♦ **Security**
- ♦ **Web**
- ♦ **Windows**
- ♦ **Wizard**

3.3 Default Preference Values

Each preference value has a default value that is implemented during installation or deployment. You can configure alternative values.

Inheriting Preference Values: In corporate directory hierarchies, preference values are inherited from higher-level objects. Some lower-level objects can override preferences set at higher-levels. Therefore, the preference values set at the user object-level override all higher-level object values.

3.4 Setting User Preferences

You can set SecureLogin user preferences in the Preferences Properties table in the Administrative Management utilities (SLManager or MMC snap-ins).

Each SecureLogin preference has a default value. In directory hierarchies, preference values are inherited from a higher-level object, while some lower-level objects can override preference set at higher level. For example, preference values set at the user object level override all higher level object values.

NOTE: This can be controlled for users by restricting their ability to set preferences.

For more information about inheriting configuration settings, see [Distributing Configurations](#).

3.5 Setting the Preferences

Set preferences for managing SecureLogin in the Administration Management utility:

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Preferences**.
- 3 Make the changes as required and click **OK**.

Use the information in the following tables while making the changes:

- ♦ [Table 3-1, “.Net Preferences,” on page 25](#)
- ♦ [Table 3-2, “Auditing Preferences,” on page 25](#)
- ♦ [Table 3-3, “General Preferences,” on page 26](#)
- ♦ [Table 3-4, “Java Preferences,” on page 34](#)
- ♦ [Table 3-5, “Web Preferences,” on page 35](#)
- ♦ [Table 3-6, “Windows Preferences,” on page 39](#)
- ♦ [Table 3-7, “Wizard preferences,” on page 41](#)

Table 3-1 .Net Preferences

| Preference | Possible Values | Description | Default Value |
|---|-----------------|---|---------------|
| Add application prompts for WindowsAutomation (DotNet) applications | Yes/No/Default | This preference prompts to add a .Net application for defining the application definition. If this preference is set to No then, the Add Application window is not launched when you launch any .Net application. | Yes |
| Allow single sign-on to WindowsAutomation (DotNet) applications | Yes/No/Default | This preference allows SSO to .Net applications. If this preference is set to No then, the application will not be available for SSO. | Yes |
| Start the WindowsAutomation (DotNet) monitor/automation worker | Yes/No/Default | This preference starts the DotNetSSO process. The Start the WindowsAutomation (DotNet) monitor/automation worker preference replaces the DISABLE_DOTNETSSO registry setting. | Yes |

NOTE: To apply the changes, restart SecureLogin.

Table 3-2 Auditing Preferences

| Preference | Possible Values | Description | Default Value |
|-------------------------------------|-----------------|---|---------------|
| Enable logging to SysLog server | Yes/No/Default | This preference controls sending the log events to SysLog server. If set to No or Default , log events are not sent to SysLog server. If set to Yes , log events are redirected to SysLog server from Windows Event log. | No |
| Enable logging to Windows Event log | Yes/No/Default | This preference controls sending the log events to Windows Event Log. This includes the entire user configuration, both local and inherited. If set to Yes or Default , log events are sent automatically to Windows Event Log. If set to No , the log events are not sent to Windows Event Log. NOTE: This preference requires SecureLogin 6.0 datastore if the value is changed. | Yes |

Table 3-3 General Preferences

| Preference | Possible Values | Description | Default Value |
|--|-----------------|--|---------------|
| Allow application definitions to be modified by users | Yes/No/Default | <p>This preference controls whether users can modify application definitions using the Definitions tabs in the Applications pane of SecureLogin client.</p> <p>If this option is set to Yes or Default, the end user can view and modify their application definitions.</p> <p>If this option is set to No, the end user cannot change their application definition.</p> <p>NOTE: If the Allow application definition to be viewed by users is set to No, then this option is cannot be edited.</p> <p>Disabling this preference does not disable the users from creating new applications through the wizards.</p> <p>This preference requires SecureLogin 6.0 datastore if the value is changed.</p> | Yes |
| Allow application definitions to be viewed by users | Yes/No/Default | <p>This preference controls whether users can view application definitions using the Definitions tabs in the Applications pane of SecureLogin client.</p> <p>If this option is set to Yes or Default, users can view the application definition.</p> <p>If this option is set to No, users cannot view the application definition.</p> | Yes |
| Allow credentials to be deleted by users through the GUI | Yes/No/Default | <p>This preference controls whether users can delete their credentials using SecureLogin client available from Manage Logins from the SecureLogin icon in the notification area (system tray).</p> <p>NOTE: If Allow credentials to be modified by users through the GUI is set to No, then this option is automatically set to No and not editable.</p> <p>This preference requires SecureLogin 6.0 datastore if the value is changed.</p> <p>If this option is set to Yes or Default, users can delete their credentials through the GUI.</p> <p>If this option is set to No, users cannot delete their credentials.</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|---|-----------------|---|---------------|
| Allow credentials to be modified by users through the GUI | Yes/No/Default | <p>This preference controls whether users can modify their credentials using SecureLogin client available from Manage Logins from the SecureLogin icon in the notification area (system tray).</p> <p>If this option is set to Yes or Default, users can modify their credentials through the GUI.</p> <p>If this option is set to No, users cannot modify their credentials through the GUI. They can only view the credentials.</p> | Yes |
| Allow user to set Obscure Show Password | Yes/No/Default | <p>This preference controls whether the user can modify the Obscure Show Password option.</p> <p>If this option is set to Yes or Default, users can modify the Obscure Show Password option and change the duration of time a password is visible.</p> <p>If this option is set to No, users cannot modify the Obscure Show Password option.</p> | Yes |
| Allow users to (de) activate SSO via system tray | Yes/No/Default | <p>This preference controls whether users can activate or deactivate SecureLogin through the SecureLogin icon in the notification area (system tray).</p> <p>If this option is set to Yes or Default, users can switch between active and inactive modes of SecureLogin.</p> <p>If this option is set to No, users cannot switch between active and inactive modes.</p> <ul style="list-style-type: none"> ◆ If SecureLogin status was active when this preference was applied, it remains as active and the user cannot de-activate SecureLogin. ◆ If SecureLogin status was inactive when this preference was applied, it remains as inactive and the user cannot change SecureLogin status to Active. <p>This preference requires SecureLogin 6.0 datastore if the value is changed.</p> | Yes |
| Allow users to backup/restore | Yes/No/Default | <p>This preference controls whether users can backup and restore their information from the Advanced menu of the SecureLogin icon on the notification area (system tray).</p> <p>If this option is set to Yes or Default, users can back up and restore their SSO information.</p> <p>If this option is set to No, users cannot back up and restore their SSO configuration.</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|--|-----------------|--|---------------|
| Allow users to close SecureLogin SSO via system tray | Yes/No/Default | <p>This preference controls whether users can access the Close option from the SecureLogin icon on the notification area (system tray).</p> <p>If the option is set to No, the Close option is shown as disabled in the SecureLogin notification area.</p> <p>If this option is set to Yes or Default, the Close option is accessible in the SecureLogin notification area.</p> <p>NOTE: This preference requires SecureLogin 6.0 datastore if the value is changed.</p> | Yes |
| Allow users to log off via system tray | Yes/No/Default | <p>This preference controls if users can log out from a session using Log Off User option from the SecureLogin icon on the notification area (system tray).</p> <p>If this option is set to No, the Log Off User option is not displayed and accessible in the SecureLogin notification area (system tray) icon.</p> <p>If this option is set to Yes or Default, the Log Off User option is displayed and accessible in the SecureLogin notification area (system tray) icon.</p> | Yes |
| Allow users to modify names of Applications and Logins | Yes/No/Default | <p>This preference controls whether users can edit the names of their Application login credentials using the Details tab > Edit function in SecureLogin client.</p> <p>If this option is set to Yes or Default, the user can edit the names of their credentials (either by right-clicking on the credential and selecting Rename, or by a slow double-click on the credential name).</p> <p>If this option is set to No, the use cannot edit the names of the credentials.</p> | Yes |
| Allow users to view and change preferences | Yes/No/Default | <p>This preference controls whether users can view and update their preferences.</p> <p>If this option is set to Yes or Default, users can view and change their preferences.</p> <p>If this option is set to No, users cannot view and change their preferences.</p> <p>NOTE: Create a separate ou for administrators to ensure that they are not adversely affected by the general user configuration preferences at the ou level.</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|--|-------------------------------------|--|---------------|
| Allow users to view and modify API preferences | Yes/No/Default | <p>This preference controls whether users can view and modify API options using the Preferences pane of SecureLogin client.</p> <p>The API preference defines the following options for users to:</p> <ul style="list-style-type: none"> ◆ Enter an API license key. ◆ Provide API access. <p>If this option is set to Yes or Default users can view and modify the API preference.</p> <p>If this option is set to No, users cannot view and modify the API preference.</p> <p>NOTE: This preference affects what is displayed in SecureLogin client using Change Preferences from the Advanced menu.</p> | Yes |
| Allow users to view passwords | Yes/Yes, per application/No/Default | <p>This preference controls whether users can view their passwords using Show Passwords in the Application pane > Details of SecureLogin client.</p> <p>If this option is set to Yes or Default, users can view their passwords.</p> <p>If this option is set to No, users cannot view their passwords.</p> <p>NOTE: Allowing users to view their passwords gives them an opportunity to view and record passwords if they need to reset the SecureLogin configuration.</p> | Yes |
| Change the cache refresh interval (in minutes) | 5 | <p>This preference defines the time in minutes the synchronization of user data and directory on the local workstation.</p> <p>This preference is available in both SecureLogin client and the administrative management utilities (SLManager and MMC snap-ins).</p> | 5 minutes |
| Display splash screen on startup | Yes/No/Default | <p>This preference controls the display of the SecureLogin splash screen during startup.</p> <p>If this option is set to Yes or Default, the splash screen appears when SecureLogin starts up.</p> <p>If this option is set to No, the splash screen is hidden and users cannot see the splash screen when SecureLogin starts up.</p> <p>NOTE: This preference requires SecureLogin 6.0 datastore if the value is changed.</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|---|---|--|---------------|
| Display user name on mouse over tray icon | Yes/No/Default | <p>This preference allows SecureLogin to display the current user name when you mouse over the SecureLogin tray icon.</p> <p>When the user logs in to SecureLogin in the offline mode, the full qualified distinguished name (FQDN) is displayed when you mouse over the SecureLogin tray icon. In the online mode, the current user's full name is displayed.</p> | No |
| Display user name on task bar | Disable/First name/Last name/Full name/Distinguished name/Default | <p>This preference controls the display of the logged in user name on the task bar.</p> <p>If this option is set to Disable, the logged in user name is not displayed on the task bar.</p> <p>If this option is set to First name/Last name/Full name/Distinguished name/Default, based on the selection respective value is displayed on the task bar.</p> <p>NOTE: For the logged in user name to be displayed in the task bar, you must right-click the Secure Login icon on the notification area (system tray) and select Show User bar or you can right-click on the task bar and select Toolbars - > SecureLogin User.</p> <p>This preference is available in both the SecureLogin Client Utility and all the administrative management utilities (SLManager and MMC snap-ins).</p> | Disable |
| Detect incorrect passwords | Yes/No/Default | <p>Predefined applications generally include commands to respond to incorrect password dialogs. This preference enables SecureLogin to respond to incorrect passwords for web applications.</p> <p>If this option is set to Yes or Default, incorrect passwords for Web applications are detected.</p> <p>If this option is set to No, incorrect passwords for Web applications are not detected.</p> <p>This preference is available in both SecureLogin client and the administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Disable single sign-on | Yes/No/Default | <p>This preference controls the users access to running SecureLogin.</p> <p>If this option is set to Yes, access to SecureLogin is disabled and it will not start when run either automatically at startup or when run manually.</p> <p>If this option is set to No or Default, access to SecureLogin is enabled and will start normally.</p> | No |

| Preference | Possible Values | Description | Default Value |
|------------------------------|-----------------|---|---------------|
| Display the system tray icon | Yes/No/Default | <p>This preference controls the display of SecureLogin icon in the notification area (system tray).</p> <p>If this option is set to Yes or Default, the SecureLogin icon appears on the notification area (system tray).</p> <p>If this option is set to No, the SecureLogin icon does not appear on the notification area (system tray).</p> <p>NOTE: When the SecureLogin icon is visible, users can double-click the icon on the notification area (system tray) to launch SecureLogin client.</p> <p>When the SecureLogin is not visible, users can start SecureLogin client through Start > Programs > NetIQ SecureLogin > NetIQ SecureLogin.</p> | Yes |
| Enable cache file | Yes/No/Default | <p>This preference controls creating and updating of a SecureLogin cache file on the local workstation. The cache file stores all user configuration data; local and inherited.</p> <p>Set this option to Yes or Default, the cache file is saved on the local workstation in the directory that was specified during install.</p> <p>Users with roaming profiles are recommended keep this setting as Yes.</p> <p>Set this option to No if you cannot store cache files locally or if this causes conflicts with your organizational security policy.</p> <p>This preference is available in both SecureLogin client and the administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|--|----------------------------|---|-----------------------------|
| Enable logging to Windows Event log | Yes/No/Default | <p>This preference controls sending the log events to Windows Event Log. This includes the entire user configuration, both local and inherited.</p> <p>If set to Yes or Default, log events are sent automatically to Windows Event Log.</p> <p>If set to No, the log events are not sent to Windows Event Log.</p> <p>Only the following events are logged:</p> <ul style="list-style-type: none"> ◆ SSO client started ◆ SSO client exited ◆ SSO client activated by user ◆ SSO client deactivated by user ◆ Password provided to an application by a script ◆ Password changed by the user in response to a change password command ◆ Password changed automatically in response to a change password command. <p>NOTE: This preference requires SecureLogin 6.0 datastore if the value is changed.</p> | Yes |
| Enable the New Login Wizard on the system tray icon | Yes/No/Default | <p>This preference controls whether users can create multiple logins on the same application using the New Login > Add New Login option from the NetIQ SecureLogin icon on the notification area (system tray).</p> <p>If this option is set to Yes or Default, the New Login menu option is enabled and users can create multiple logins.</p> <p>If this option is set to No, New Login menu option is disabled and users cannot create multiple logins.</p> | Yes |
| Enforce passphrase use | Yes/No/Default | <p>This preference forces users to set up a passphrase question and answer when SecureLogin is launched by a user for the first time.</p> <p>If this option is set to Yes, users must complete setting up their passphrase before they proceed with any other activity on the workstation.</p> <p>If this option is set to No or Default, users can postpone setting up the passphrase. If the users clicks Cancel or closes the dialog, then SecureLogin does not start.</p> | No |
| Enter API license key(s) | Specify API license key(s) | <p>Specify the API license key(s) provided by SecureLogin to activate the API functionality for an application.</p> <p>You can add more than one API license key.</p> | Specify the API license key |
| Obscure Show Password (seconds) | Integer value in seconds | Restricts the password display time when you click the Show Password button in the local interface. | 30 |

| Preference | Possible Values | Description | Default Value |
|--|-----------------------|--|---------------|
| Password protect the system tray icon | Yes/No/Default | <p>This preference restricts the users from accessing the NetIQ SecureLogin icon menu option (from the notification area (system tray) without their network login password.</p> <p>When set to Yes, the SecureLogin icon on the notification area password protected.</p> <p>When set to No or Default, the SecureLogin icon on is not password protected.</p> <p>This preference is available in both SecureLogin client and the administrative management utilities (SLManager and MMC snap-ins).</p> <p>NOTE: Always select the Synchronize NDS password with Universal Password option when NMAS is used.</p> | No |
| Provide API Access | Yes/No/Default | <p>This preference controls the API functionality use.</p> <p>If this option is set to Yes, the API access is enabled.</p> <p>If this option is set to No or Default, the API access is disabled.</p> <p>This preference is available in both SecureLogin client and the administrative management utilities (SLManager and MMC snap-ins).</p> | No |
| Stop walking here | Yes/No/Default | <p>This preference controls the inheritance of settings from higher level containers or organizational units.</p> <p>If this option is set to Yes, the inheritance of settings from higher level containers or organizational units is disabled.</p> <p>Set the option to Yes during phased upgrades when higher levels might have a different version of SecureLogin implemented.</p> <p>If this option is set to No or Default, the inheritance of settings from higher level containers or organizational units is enabled.</p> <p>This preference does not apply when SecureLogin is installed in eDirectory environment. The Corporate redirection functionality; that is, the inheritance settings from higher level container or organizational units is bypassed in an eDirectory environment.</p> | No |

| Preference | Possible Values | Description | Default Value |
|------------------------------|-----------------------|---|---------------|
| Use Passphrase Policy | Yes/No/Default | <p>This preference controls if users can set passphrase policies using administrative management tools.</p> <p>If this option is set to Yes, then the users can set or edit the passphrase policies using any of the supported administrative management tools (iManager, MMS, or sIManager).</p> <p>If this option is set to No or Default, the users cannot set or edit the password policies.</p> | |

Table 3-4 Java Preferences

| Preference | Possible Values | Description | Default Value |
|--|-----------------------|--|---------------|
| Add application prompts for Java applications | Yes/No/Default | <p>This preference prompts to add a Java application for defining the application definition.</p> <p>When set to No, the Add Application window is not launched when you launch any Java application.</p> | Yes |
| Allow single sign-on to Java applications | Yes/No/Default | <p>This preference controls whether SecureLogin allows SSO for Java applications.</p> <p>If the preference is set to Yes or Default, SecureLogin prompts the user to enter credentials (if none already exist), or submits existing credentials on the Java application login page.</p> <p>If this option is set to No, Java applications are not enabled for SSO.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

Table 3-5 Web Preferences

| Preference | Possible Values | Description | Default Value |
|--|-----------------|---|---------------|
| Add application prompts for Internet Explorer | Yes/No/Default | <p>This preference controls the display of the Web login detection wizard and confirmation dialog box when a Web application is detected and recognized by Internet Explorer.</p> <p>If you select Yes or Default, the user is initially prompted to enable the application and enter the credentials for the application (if not done previously).</p> <p>NOTE: Setting the preference to Yes when displayed to users depends on the settings of the “Wizard mode” on page 41 preference.</p> <p>On subsequent runs of the application, the user is not prompted for credentials and SSO occurs seamlessly.</p> <p>If you select No, SecureLogin skips enabling the application for SSO, the user is never be prompted to enable the application.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Add application prompts for Mozilla Firefox | Yes/No/Default | <p>This preference controls the display of Web login detection wizard and confirmation dialog box when a Web application is detected and recognized by Mozilla Firefox.</p> <p>NOTE: Setting the preference to Yes when displayed to users depends on the settings of the “Wizard mode” on page 41 preference.</p> <p>If you select Yes or Default, the user is initially prompted to enable the application and enter the credentials for the application (if not done previously). On subsequent runs of the application, the user is not prompted for credentials and SSO occurs seamlessly.</p> <p>If you select No, SecureLogin skips enabling the application for SSO for this instance. You are prompted to enable the application when you launch it the next time.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|--|-----------------|---|---------------|
| Add application prompts for Google Chrome | Yes/No/Default | <p>This preference controls the display of Web login detection wizard and confirmation dialog box when a Web application is detected and recognized by Google Chrome.</p> <p>NOTE: Setting the preference to Yes when displayed to users depends on the settings of the “Wizard mode” on page 41 preference.</p> <p>If you select Yes or Default, the user is initially prompted to enable the application and enter the credentials for the application (if not done previously). On subsequent runs of the application, the user is not prompted for credentials and SSO occurs seamlessly.</p> <p>If you select No, SecureLogin skips enabling the application for SSO on this instance. You are prompted to enable the application when you launch it the next time.</p> <p>This preference is available in both SecureLogin Client Utility and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Add application prompts for Microsoft Edge | Yes/No/Default | <p>This preference controls the display of Web login detection wizard and confirmation dialog box when a Web application is detected and recognized by Microsoft Edge.</p> <p>NOTE: Setting the preference to Yes when displayed to users depends on the settings of the “Wizard mode” on page 41 preference.</p> <p>If you select Yes or Default, the user is initially prompted to enable the application and enter the credentials for the application (if not done previously). On subsequent runs of the application, the user is not prompted for credentials and SSO occurs seamlessly.</p> <p>If you select No, SecureLogin skips enabling the application for SSO on this instance. You are prompted to enable the application when you launch it the next time.</p> <p>This preference is available in both SecureLogin Client Utility and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|--|-----------------|--|---------------|
| Add application prompts for web pages on mutation | Yes/No/Default | <p>This preference controls the display of Web login detection wizard and confirmation dialog box when a Web application includes mutation events.</p> <p>NOTE: Setting the preference to Yes when displayed to users depends on the settings of the “Wizard mode” on page 41 preference.</p> <p>If you select Yes or Default, the user is not prompted to enter the credentials on the subsequent web pages that include mutation events but initially is prompted to enable the application and enter the credentials for the application (if not done previously).</p> <p>If you select No, SecureLogin skips enabling the application for SSO for the web pages that include mutation events.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | No |
| Allow HTML Authentication single sign-on to Google Chrome | Yes/No/Default | <p>This preference defines SSO access to HTML Authentication requests using Google Chrome.</p> <p>If you select Yes or Default the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin skips enabling the application for SSO for this instance. You are prompted to enable the application when you launch it the next time.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Allow HTML Authentication single sign-on to Microsoft Edge | Yes/No/Default | <p>This preference defines SSO access to HTML Authentication requests using Microsoft Edge.</p> <p>If you select Yes or Default the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin skips enabling the application for SSO for this instance. You are prompted to enable the application when you launch it the next time.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|--|-----------------------|--|---------------|
| Allow HTML Authentication single sign-on to Mozilla Firefox | Yes/No/Default | <p>This preference defines SSO access to HTML Authentication requests using Mozilla Firefox.</p> <p>If you select Yes or Default the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin skips enabling the application for SSO for this instance. You are prompted to enable the application when you launch it the next time.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Allow single sign-on to Internet Explorer | Yes/No/Default | <p>This preference defines SSO access to web application using Internet Explorer.</p> <p>If you select Yes or Default, the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin does not prompt for credentials (if none exist or are incorrect) and does not submit credentials into the application.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Allow single sign-on to Mozilla Firefox | Yes/No/Default | <p>This preference defines SSO access to Web application using Mozilla Firefox.</p> <p>If you select Yes or Default the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin does not prompt for credentials (if none exist or are incorrect) and does not submit credentials into the application.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Allow single sign-on to Google Chrome | Yes/No/Default | <p>This preference defines SSO access to Web application using Google Chrome.</p> <p>If you select Yes or Default the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin does not prompt for credentials (if none exist or are incorrect) and does not submit credentials into the application.</p> <p>This preference is available in both SecureLogin Client Utility and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|---|-----------------|---|---------------|
| Enable DHTML monitor on web pages | Yes/No/Default | <p>This preference enables SSO for web pages that require DHTML script. You can enable or disable the DHTML setting.</p> <p>For DHTML applications that depend on mutation events, Add application prompts for web pages on mutation must be set to Yes to SSO to the application.</p> | Yes |
| Enable WebSSO defined applications as allowlist | Yes/No/Default | <p>This preference allows user to enable WebSSO defined applications as allowlist.</p> <p>When set to No or Default, the allowlist rules are not applied.</p> <p>When set to Yes, the allowlist rules are applied, that is, other web applications are not taken into consideration for Wizard auto prompting and Single Sign-On (SSO).</p> <p>You can use Add Application to override the preference and still consider applications for Wizard auto prompting and SSO.</p> | No |
| Start the Flash monitor/automation worker | Yes/No/Default | This preference starts the flash SSO process. | No |

Table 3-6 Windows Preferences

| Preference | Possible Values | Description | Default Value |
|--|-----------------|---|---------------|
| Add application prompts for Windows applications | Yes/No/Default | <p>This preference controls the display of a Windows login detection and confirmation message when a Windows application is detected and recognized.</p> <p>If you select Yes or Default, the user prompted to enable the application and to enter the credentials for the application (if not done previously).</p> <p>On subsequent runs of the application, the user is not prompted for credentials and SSO occurs seamlessly.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |

| Preference | Possible Values | Description | Default Value |
|---|-----------------|--|---------------|
| Allow single sign-on to Windows applications | Yes/No/Default | <p>This preference defines SSO access to Windows applications.</p> <p>If you select Yes or Default the specified credentials are saved and the application is enabled for SSO.</p> <p>If you select No, SecureLogin will not prompt for credentials (if none exist or are incorrect) and will not submit credentials into the application.</p> <p>This preference is available in both SecureLogin client and administrative management utilities (SLManager and MMC snap-ins).</p> | Yes |
| Allow single sign-on to Windows applications using DotNet automation worker | Yes/No/Default | <p>This preference allows single sign-on to Windows applications using the DotNet automation worker.</p> <p>If this preference is set to No or Default, the windows application is not single signed-on by the DotNet automation worker.</p> <p>If the preference is set to Yes, Windows applications are single signed-on by the DotNet worker.</p> | |
| Start the Windows 32bit (WinSSO32) monitor/automation worker | Yes/No/Default | This preference starts the WinSSO32 process. | Yes |
| Start the Windows 64bit (WinSSO64) monitor/automation worker | Yes/No/Default | This preference starts the WinSSO64 process for Windows on a 64-bit machine. | Yes |
| NOTE: To apply the changes, restart SecureLogin. | | | |

Table 3-7 Wizard preferences

| Preference | Possible Values | Description | Default Value |
|--|---------------------------------|---|---------------|
| Show Add Application wizard with minimal actions | Yes/No/Default | <p>This preference controls displaying the prompt for SSO with minimum options.</p> <p>If you set this preference to Yes, the Add Application wizard displays the following options:</p> <ul style="list-style-type: none"> ♦ Yes, I want to single sign using the default selections done by the wizard. ♦ Cancel, I do not want to single sign this screen at this time. ♦ No, never prompt me to single sign this screen. <p>If you set this preference to No then, the default options are displayed to SSO to the application.</p> | No |
| Skip the wizard process and use defaults for new forms | Yes/No/Default | <p>This preference controls the wizard process.</p> <p>If you set this preference to Yes, then the default wizard selections are applied for all the pages of the application and you can switch between the panes instead of making changes sequentially.</p> | No |
| Wizard mode | Administrator/ User/Disabled | <p>This preference controls that access to the application definition wizard.</p> <p>If this option is set to Administrator, it gives users' complete access to the application definition wizard. Users can create their own application definitions.</p> <p>If this option is set to User, users are only allowed to create new login credential sets for new applications using the auto-detection settings.</p> <p>If this option is set to Disabled, the application definition wizard is not launched.</p> <p>NOTE: This preference requires SecureLogin 6.0 datastore if the value is changed.</p> | Administrator |

3.6 Configuring the Exclude.ini File

You can configure the `exclude.ini` file to exclude applications or classes of applications that do not require SSO. For example, exclude an anti-virus application because it does not require SSO. Configure the `exclude.ini` file to achieve the following outcomes:

- ♦ Exclude heavy applications that might cause performance issues.
- ♦ Exclude the classes that do not require SSO to improve the performance of applications.

IMPORTANT: SecureLogin does not process the applications or classes specified in `exclude.ini` for SSO even if the application definition is published for these applications.

By default, SecureLogin does not process the following executables for SSO for optimal performance:

```
msdev.exe
slbroker.exe
tlaunch.exe
slproto.exe
notes.exe
nswebsso.exe
nwadmn32.exe
nwadmnt.exe
nwadmn95.exe
loginw95.exe
setup.exe
nwtray.exe
loginw32.exe
scrnlock.scr
wfica32.exe
mmc.exe
slwinsso.exe
slmanager.exe
sillock.scr
```

Perform the following steps to configure the `exclude.ini` file:

- 1 Create an `exclude.ini` file in the `C:\Program Files\NetIQ\SecureLogin` directory.

IMPORTANT: If you are using Notepad to create or edit the file, set the encoding to Unicode.

- 2 Specify the application executables or classes in the `exclude.ini` file in the following format:

```
Include
executable1.exe
executable2.exe

Classes
class1
class2

Nodefault
Exclude
default1.exe
default2.exe
```

In this example configuration of `exclude.ini`, SecureLogin will perform the following tasks:

1. SecureLogin will process `executable1.exe` and `executable2.exe` for SSO.
2. SecureLogin will not process `class1` and `class2` for SSO.
3. SecureLogin will not process `default1.exe` and `default2.exe` for SSO. It will override the default configuration.

4 Managing Passphrases

In this Chapter

- ♦ [About Passphrases](#)
- ♦ [Creating a Passphrase Question](#)
- ♦ [Resetting a Passphrase Answer](#)
- ♦ [Changing the Passphrase Prompt](#)
- ♦ [Changing a Passphrase](#)

4.1 About Passphrases

Passphrases are an important security component in the implementation of SecureLogin. Passphrases are unique question and answer combinations created to verify and authenticate the identity of a user. In a directory environment, you can create passphrase questions for users. Users can select one of these questions and provide an answer for it. You can also permit users to provide a question of their choice and the answer for it.

Passphrases protect user credentials from unauthorized use. For example, in an Microsoft Active Directory environment, an administrator can reset the users network password and then log in as that user and gain access to the users information.

However, this cannot happen when you are using SecureLogin. If someone other than the actual users tries to reset the network password, SecureLogin triggers the passphrase question. The user must provide the correct answer before successfully logging in. Even an administrator cannot access the user's single sign-on-enabled applications without knowing the user's passphrase answer.

When SecureLogin is launched for the first time on a user's workstation, the Passphrase Setup dialog box is displayed.

NOTE: ♦ In a Microsoft Windows Vista or higher environment, when you log in to SecureLogin in an offline mode with an incorrect password, you are prompted to provide the passphrase answer. If an incorrect passphrase answer is specified, you are prompted to retry the authentication. However, if you again provide a wrong password, instead of seeing a prompt for the passphrase answer, you are prompted to specify the password (that is, instead of the passphrase dialog box, the password dialog box is displayed). Close and relaunch SecureLogin to be prompted for the password first, then prompted for the passphrase answer if the incorrect password is specified

- ♦ SecureLogin using the Novell Client does not support non-password-based NMAS logins if the passphrase options are disabled. This is not supported because SecureLogin either fails to open the local cache or opens the local cache file without any password.
 - ♦ Also, Offline authentication does not work if you do a non-password-based NMAS authentication with the Passphrase Security System disabled. This is because SecureLogin in offline mode accepts only passphrases for non-password-based NMAS authentication. This scenario occurs only if SecureLogin is installed in Novell Client mode.
-

Passphrase Authentication

Passphrases are used to authenticate when:

- ♦ A user is working either remotely or offline in an eDirectory or non-Microsoft Active Directory LDAP environment.
- ♦ Someone other than the actual user resets the network password.

Benefits of Passphrases

- ♦ An individual cannot access a user's credentials by resetting the network password.
- ♦ Passphrases can be used in conjunction with SecureLogin Self-Service Password Reset, which enables users to reset their network password after answering the passphrase question.
- ♦ You can use this functionality to disable access to user credentials if the computer is stolen.

NOTE: You can disable the passphrase security system, but it also removes the features mentioned in the preceding section.

4.2 Creating a Passphrase Question

As an administrator, you can perform the following actions:

- ♦ Create one or more passphrase questions for users to select.
- ♦ Enable users to create their own passphrase question and answer.
- ♦ Set up a combination of both.

To create a passphrase question:

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Advanced Setting**. The advanced setting options are deployed.
By default, **User-defined passphrase questions** is selected. Deselect this option if you do not want users to create their own passphrase question and answer.
- 3 Click **New**.
- 4 In the Enter a new passphrase question dialog box, provide your passphrase question.
- 5 Click **OK**. The question you provided is displayed in the **Corporate passphrase questions** field.
This passphrase question is displayed to all users associated with the selected object.
- 6 Repeat steps 3 to step 5 to create additional passphrases.

IMPORTANT: Ensure to click **OK** after you create the passphrase question to save the changes and exit the page.

The passphrase answer is specified by the users when they set up the passphrase question and answer. Passphrase answers must contain a minimum of six characters. However, you can change the policy to suit your security requirement. For more information, see [Changing a Passphrase Policy](#).

It is recommended to not apply strict policies to passphrase answers as it make them harder to remember. Instead, use a multi-value question, such as `What is you driving license number plus Your Mother's name?` and set a passphrase policy based on that.

4.3 Resetting a Passphrase Answer

If a user forgets the passphrase answer, you must reset the user's SecureLogin configuration to ensure that the user's data is secure. This deletes all user-specific information, including user names and passwords.

For more information, see [Section 2.6, "Deleting or Re-setting User Data,"](#) on page 20.

IMPORTANT: When you set up a user's passphrase question and answer policies, we recommend that you keep them simple so that the user can easily remember the answer.

4.4 Changing the Passphrase Prompt

You can change the passphrase prompt that users see in the Passphrase Setup dialog box the first time they log in.

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Advanced Settings**. The Advanced Settings options are displayed.
- 3 Under **Customized Passphrase Prompt**, select **Modify the passphrase prompt window text**. The **Custom prompt** is now active.
- 4 Specify the new prompt.
- 5 Click **OK** to save the changes and close the Administrative Management utility. Log in as a new user to view the customized prompt.

4.5 Changing a Passphrase

Users can change their passphrase answer depending on how you configure SecureLogin.

- 1 Right-click the SecureLogin icon in the notification area (system tray), then select **Advanced > Change Passphrase**. The Passphrase dialog box is displayed.
- 2 Specify the passphrase answer in the field.
- 3 Click **OK**.
- 4 In **Enter a question**, select or specify a passphrase question.
- 5 In **Enter the answer**, specify the new passphrase answer.
- 6 In **Confirm the answer**, retype the new passphrase answer.
- 7 Click **OK**.

NOTE: Users who do not have access to the SecureLogin icon cannot change their passphrases. You can temporarily enable access to the icon to allow the user to change the passphrase with the [Display the system tray icon](#) preference setting.

5 Managing Passphrase Policies

- ♦ Section 5.1, “About Passphrase Policies,” on page 47
- ♦ Section 5.2, “Changing a Passphrase Policy,” on page 47
- ♦ Section 5.3, “Enabling the Passphrase Security System,” on page 48
- ♦ Section 5.4, “Checking the Passphrase Security System Status,” on page 50
- ♦ Section 5.5, “Passphrase Security System Scenarios,” on page 51

5.1 About Passphrase Policies

A passphrase is an integral part of the security architecture of SecureLogin. It can be used to secure single sign-on data when a user authenticates to applications.

A policy is used to restrict the format and content of passphrase answers, including length, whether numeric characters are required, and whether passphrases must be uppercase or lowercase. For example, you could set **Begin with an uppercase character** to **Yes** and **Maximum uppercase characters** to **1**, and **Prohibit characters** to **Disallow spaces**. You could also require all passphrase answers to start with uppercase and have the rest of the characters as lowercase.

You can set passphrase policies using any of the supported administrative management tools (MMS or SLManager).

5.2 Changing a Passphrase Policy

The passphrase policy now applies to all users inheriting configuration from the selected object. You can change or disable it at any time.

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Advanced Settings**.
- 3 Select **Use a passphrase policy**.
- 4 Click **Edit Policy**.
- 5 In the **Setting Description** column, click the policy rule you want to edit, then in the **Value** column, specify the required value.

For example, if you think that users might find it easier to remember basic rules for all passphrases instead of remembering exactly how they typed a passphrase when they created it, you could require all passphrases to contain a minimum of 6 characters and a maximum of 12 characters. Set **Minimum length** to 6 and set **Maximum length** to 12.

By default, passphrase responses are required to contain a minimum of six characters. For security reasons, any passphrase policy you implement must also contain a minimum of six characters.

- 6 Click **OK**. The new values are added to the **Value** column.

5.3 Enabling the Passphrase Security System

This section contains information about the following:

- ♦ [Section 5.3.1, “Enabling the Passphrase Security Using PKI Encryption,” on page 49](#)
- ♦ [Section 5.3.2, “Enabling the Passphrase Security Using PKI Encryption,” on page 50](#)

The **Enable Passphrase Security System** option determines if users can use a passphrase to decrypt single sign-on data.

If the passphrase system is not used, this exposes the users’ single sign-on data if a third party can to reset the users network password. It is strongly recommended you enforce passphrase system on users environment.

To view or modify this preference:

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Preferences**.
- 3 Select **Security > Enable passphrase security system**, select **Yes** or **Hidden**.
- 4 Click **Apply**.
- 5 Click **OK**.

You can set the **Enable Passphrase Security System** preference to **Yes** or **Hidden** depending on the enterprise security requirements.

If the **Enable Passphrase Security System** is set to **Yes**, (which is the default preference) the user is prompted to set the passphrase question and answer when SecureLogin is launched for the first time.

If the **Enable Passphrase Security System** is set to **Hidden**, the user is not prompted to set the passphrase question and answer when SecureLogin is launched for the first time.

WARNING: If you change the preference from **Hidden** to **Yes**, users must answer the passphrase questions to use SecureLogin. Typically, users are not prompted to create a passphrase after the first login.

Without any message indicating the change in the preference, users are prompted for the passphrase answer. So, avoid changing the preference.

You have two options depending on what you specified.

- ♦ Users can create both the passphrase question and answer.
- ♦ You predefine a list of questions and answers, and the user selects from the list.

When users have set a passphrase, the application generates a random key, and a one-way hash of the passphrase answer encrypts this key. Later, the application key encrypts the new key. This key protects users’ SecureLogin credentials and passwords so that even someone with Supervisor rights to the network and access to Microsoft Management Console (MMC) is unable to view a user’s passwords to applications.

After the passphrase is set, every time a user logs in to the network, SecureLogin loads seamlessly.

Typically, the prompt to create a passphrase is never seen after the first login. However, if an administrator resets the user's directory or network, the next time SecureLogin launches, users must answer the passphrase question before SecureLogin continues. This prevents other users from changing the user's directory password, logging on as the user, obtaining access to the SecureLogin data, and using it to run applications.

5.3.1 Enabling the Passphrase Security Using PKI Encryption

You cannot toggle the **Enable Passphrase Security System** setting when the users forget their smart card unless they had previously set a passphrase or had it randomly generated using the **Hidden** option.

If users are required to authenticate to the network by using passwords, **Enable Passphrase Security System** must be set either to **Yes** or **Hidden**.

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Preferences**.
- 3 Under **Security**, select **Yes** or **Hidden** in **Enable passphrase security passphrase**.
- 4 Click **Apply**.
- 5 Click **OK**.

If you select **Yes**, users must select a passphrase question and answer when they log in to SecureLogin for the first time. When the passphrase system is enabled, users are prompted to answer their passphrase question if their password has been reset by the administrator.

NOTE: With the **Use smart card to encrypt SSO data** option selected (either **PKI credentials** or **Key generated on smart card**), you can use the passphrase to decrypt single sign-on data if the user's smart card is damaged or lost.

This setting must be used in conjunction with the **Lost card scenario** preference set to **Allow passphrase** and **Store credentials on the smart card** preference set to **No**. You can toggle these preferences if the user's smart card is forgotten providing the user's passphrase has already been set. The user is prompted to answer the passphrase question before SecureLogin loads.

For more information, see [Section 8.5, "Lost Card Scenarios," on page 70](#).

If the **Hidden** preference is selected, users are not prompted to set a user-defined passphrase. A user key is generated automatically with any input from the user.

The **Enable Passphrase Security System** cannot be set to **No** unless **Use smart card to encrypt SSO data** is set to **PKI credentials**.

If users are required to authenticate to the network by using passwords, the **Enable passphrase security system** option must be set to **Yes** or **No** or **Hidden**.

IMPORTANT: With the passphrase security system set to **Hidden**, a directory administrator can reset a user's directory password, log in as the user, and access the user's single sign-on data because they are not prompted to answer a passphrase question.

5.3.2 Enabling the Passphrase Security Using PKI Encryption

If the **Use smart card to encrypt SSO data** is set to **PKI credentials**, the user's single sign-on data is encrypted by using the public key from the selected certificate and the private key and stored on a PIN-protected container on the user's smart card. Both, the user's directory datastore and the local cache are now protected by the PKI credentials.

The single sign-on data can be encrypted by using the private key that is PIN-protected and stored on the user's smart card for added security. Only the user who has the physical possession of the smart card and knowledge of the PIN can decrypt the single sign-on data.

To set the **Use smart card to encrypt SSO data** preference:

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Preferences**.
- 3 Select **Security > Use smart card to encrypt SSO data > PKI credentials, Key Generated On Smart Card**, or **No**.
- 4 Click **Apply**.
- 5 Click **OK**.

If the **Use smart card to encrypt SSO data** is set to **PKI credentials**, the **Enable passphrase security system** can be set to **No**.

If the **Use smart card to encrypt SSO data** is set to **No**, the user's passphrases are completely disabled and the user's smart card is always required to decrypt the single sign-on data.

IMPORTANT: If your enterprise chooses to disable the passphrase security system:

- ♦ You can still access a user's credentials by resetting the network password.
- ♦ The functions of using the passphrases in conjunction with SecureLogin Self Service Password Reset (SLSSPR) is disabled. The SecureLogin Self Service Password Reset enables a user to reset his or her network passwords after answering the passphrase questions.

The supported directory modes for disabling the passphrase security system are:

- ♦ Active Directory
- ♦ LDAP-compatible
- ♦ eDirectory (if SecretStore is used)

For information about the scenarios that a user might experience when the **Enable passphrase security system** option is set to **No**, see [Passphrase Security System Scenarios](#).

5.4 Checking the Passphrase Security System Status

On the notification area (system tray), right-click the SecureLogin icon > **About**.

The status appears next to the `Database Mode` and is listed as `PP Enabled` or `PP Disabled`.

5.5 Passphrase Security System Scenarios

The information provided in this section describes the user experience in environments where the passphrase security system has been enabled and disabled.

Scenario 1: The passphrase security system is disabled in a previously enabled environment

When the passphrase security system is disabled in an environment where it was previously enabled, the following message appears to users the next time they log in.

If the user clicks **OK**, the disabling of the passphrase security system is approved and the user is prompted for the current password. The approval is complete when the user provides the password.

If the user click **Cancel**, the passphrase security system disabling is delayed and the user is prompted with the message until he or she clicks **OK** to approve the change.

NOTE: Users must answer the passphrase answer to prevent the administrators to toggle this preference and allow an unauthorized user access SecureLogin.

Scenario 2: The passphrase security system is re-enabled in a previously disabled environment

If the passphrase security system is re-enabled, the Passphrase Setup dialog box is displayed (similar to when a user logs in for the first time after installing SecureLogin.)

If the user clicks **OK**, the user resets the passphrase question and answer.

If the user clicks **Cancel**, there is a delay in enabling the passphrases for the user's workstation. The user is prompted at subsequent log ins until he or she specifies a passphrase question and answer.

Scenario 3: The passphrase security system is disabled and the user has changed his or her passwords (restrictions for moving user objects)

If you reset the user's password when the passphrase security system is disabled:

- ♦ In an LDAP-compatible and eDirectory (with SecretStore) modes, you cannot move the user object to another organizational unit until that user has logged in to SecureLogin on his or her workstation. You must move the object back to its previous location to enable the user to run SecureLogin.
- ♦ In an Active Directory mode, you can move the user object within the directory. If the user object is moved, you must move the object back to its previous location to enable the user to run SecureLogin.

Scenario 4: Forgotten Passphrase

If a user forgets SecureLogin data, including his or her passphrase or passphrase answer, you must delete the user's existing SecureLogin datastore.

After the datastore is deleted, the user's corporate applications, credentials, preferences, and user policies are permanently removed. You must then reset the user's corporate password before he or she can log in and reconfigure the applications by using SecureLogin.

The next time SecureLogin starts, he or she must manually log in. SecureLogin then detects that a passphrase is not set and prompts the user to set up the passphrase before continuing. You can create a list of predefined list of passphrases questions.

After the user has set a new passphrase, he or she must re-enter the application user names and passwords. If it is not done, an unauthorized could breach security by clearing the passphrase, entering a new passphrase, and accessing the actual user's credentials.

You might need to reset the user's application passwords as they might have forgotten them.

6 Managing Credentials

- ♦ [Section 6.1, “About Credentials,” on page 53](#)
- ♦ [Section 6.2, “Creating a User Login and Credentials,” on page 53](#)
- ♦ [Section 6.3, “Deleting a User Login and Credentials,” on page 54](#)
- ♦ [Section 6.4, “Linking a Login to an Application,” on page 54](#)

6.1 About Credentials

The first time a user logs in after creating an application definition and activating it for single sign-on, the user is prompted to provide credentials in a SecureLogin dialog box. SecureLogin then stores and associates these credentials with the application definition and uses it in subsequent logins.

Because individual application requirements determine the credentials that users must enter when manually logging in, only those credentials are stored and remembered by SecureLogin. For example, if users have an application that only requires username and password, SecureLogin encrypts and stores the username and password for subsequent logins. Alternatively, some applications require the user to enter domain and database names, IP addresses, and select various options on Web pages. SecureLogin can handle all these on behalf of the user.

You can display and manage these credentials in the **Logins** page of the Administrative Management utility and the **My Logins** pane of the SecureLogin Client Utility.

Credentials stored in a directory environment apply to all associated objects. For example, if users access an application located on a specific domain, and they are required to manually select or provide the domain address, then the domain must be configured as a credential in the **Logins** pane at the organizational unit level. Thereby, users need not manually provide the domain location when they log in. You can then change the domain at any time without notifying users.

Application credentials such as e-mail, finance system, human resource system, and travel system are typically stored for user objects and apply only to (and can be used by) the particular user. For example, John’s application credentials are encrypted and stored against John’s user object and only available to him. When he starts an application, SecureLogin retrieves, decrypts, and enters the credentials on behalf of John.

6.2 Creating a User Login and Credentials

Logins and credentials are typically created automatically as part of the application definition, but you can manually create and edit them, if required.

To create logins and credentials:

- 1 On the notification area (system tray), double-click the SecureLogin icon.
- 2 Click **My Logins**. The existing Logins are displayed.
- 3 Click **New**.

- 4 In the **Name/Id** field, specify a Name/ID for the login.
- 5 Click **OK**. The Login name/ID is added to the My Logins pane.
- 6 From the My Logins on the left pane, select the login you have created.
- 7 Click **New**. The Create Credential dialog box is displayed.
- 8 In the **Name** field, specify a name for the new credential.
- 9 Click **OK**. The new credential is added to the Login details.
- 10 In the Value column, specify a value for the credential.
- 11 Click **Apply**. The new credential variable and its value are displayed.

6.3 Deleting a User Login and Credentials

An admin can delete the single sign-on configuration for a user using the SecureLogin Manager (SLManager). This includes deleting the applications, logins, and credentials of a user. Perform the following task to delete the single sign-on configuration:

- 1 Launch SLManager.
- 2 Click the username for which you want to delete the single sign-on configuration.
- 3 Click **Advanced Settings**.
- 4 Click **Datastore**.
- 5 In the **Single sign-on configuration** pane, click **Delete**.

IMPORTANT: If SecretStore is configured with SecureLogin, you must delete the logins and credentials of the user from the SecretStore vault. For more information, see [Removing a Secret](#) in the [SecretStore Administration Guide](#).

6.4 Linking a Login to an Application

You can link a login to an application in the appropriate Login pane. For example, if users are logging in to Microsoft Outlook using a set of credentials and they are also logging in to Outlook Web Access, then they can share or link the credentials to the Web login application definition.

To link a login to an application:

- 1 In the notification area (system tray), double-click the SecureLogin icon on the system tray. The SecureLogin Client Utility is displayed.
- 2 Click **My Login** and the login that you want to an application.
- 3 Click **Link** icon. The Applications List dialog box displays the list of enabled predefined applications and application definitions.
- 4 Select the application that you want to link.
- 5 Click **OK**. The linked application is added.
- 6 Click **OK** to save changes and close the SecureLogin Client Utility.

7 Managing Password Policies

SecureLogin provides the password policy functionality to enable you to efficiently and effectively manage user passwords to comply with your organization's security policies.

This section provides information about the following:

- ♦ [Section 7.1, “About Password Policies,” on page 55](#)
- ♦ [Section 7.2, “Password Policy Properties,” on page 56](#)
- ♦ [Section 7.3, “Creating a New Password Policy,” on page 58](#)
- ♦ [Section 7.4, “Linking a Policy to an Application,” on page 59](#)

7.1 About Password Policies

You can create password policies at a container, OU, Group Policy, and user object level. Policies set at the container or organizational unit level are inherited by all associated directory objects. Password policies set at the user object level override all higher-level policies. Password policies are linked to application definitions through scripting and are not applied to directory objects. You can do this by creating a password policy in the Password Policies pane, then linking the policy to the application definition by editing the application script and adding the `RestrictVariable` command. For more information about linking a password policy, see [Linking a Policy to an Application](#).

Password policies are comprised of one or more password rules applicable to one or more single sign-on enabled applications and to specific directory objects. You can configure password policies in the **Password Policy Properties** tables of the Administrative Management utilities.

SecureLogin remembers the passwords and handles password changes after they expire on the back-end application. For example, after 30 days or when users decide to change their password. The SecureLogin password management functionality includes the capability to set password expiry duration and generate passwords that comply with specified password policies.

Password policies are typically created to match existing password policies. You should consult application owners before changing an existing password policy.

To determine requirements and parameters of the password policy and applications the password policy applies to, test complex policies on a test user account to ensure that they are viable.

7.1.1 Using Application Definition Wizard to Create Password Policy

You can create password policies through the application definition wizard while enabling application for single sign-on. For more information about using the application definition wizard, see the [NetIQ SecureLogin 9.1 Application Definition Wizard Administration Guide](#).

However, you cannot use the wizard to edit or delete password policies.

7.2 Password Policy Properties

Organizations and applications often have rules about the content of passwords, including the required number and type of characters. The **Password Policy Properties** table helps you to create and enforce these password rules through a password policy, and apply this policy to one or more applications.

Table 7-1 *The Password Policy Properties Table*

| Policy | Value | Description |
|---------------------------------------|-------------------------------------|--|
| Minimum length | Whole number | Defines the required minimum number of characters. |
| Maximum length | Whole number | Defines the required maximum number of characters. |
| Minimum punctuation characters | Punctuation characters | Defines the minimum number of punctuation characters allowed in a password. |
| Maximum punctuation characters | Punctuation characters | Defines the maximum number of punctuation characters allowed in a password. |
| Minimum uppercase characters | Whole number | Defines the minimum number of uppercase characters allowed in a password. |
| Maximum uppercase characters | Whole number | Defines the maximum number of uppercase characters allowed in a password. |
| Minimum lowercase characters | Whole number | Defines the minimum number of lowercase characters allowed in a password. |
| Maximum lowercase characters | Whole number | Defines the maximum number of lowercase characters allowed in a password. |
| Minimum numeric characters | Whole number | Defines the minimum number of numeric characters allowed in a password. |
| Maximum numeric characters | Whole number | Defines the maximum number of numeric characters allowed in a password. |
| Disallow repeat characters | No/Yes/Yes, case insensitive | <p>Disallows the use of repeated characters, or the use of the same successive characters.</p> <p>If this option is set to No, characters can be repeated. This is the default value.</p> <p>If this option is set to Yes, same alphabetic characters in a different case are considered as different characters. For example, A and a are different.</p> <p>If this option is set to Yes, case insensitive, the successive use of the same alphabetic characters in a different case is not allowed.</p> |

| Policy | Value | Description |
|-----------------------------------|------------------------------|--|
| Disallow duplicate characters | No/Yes/Yes, case insensitive | <p>Disallows the use of the same non-successive characters.</p> <p>If this option is set to No, duplicate characters are allowed. This is the default value.</p> <p>If this option is set to Yes, the same alphabetic characters in a different case are considered as different characters. For example, A (uppercase) and a (lowercase) are different.</p> <p>If this option is set to Yes, case insensitive, duplication of the same alphabetic characters in a different case is not allowed.</p> |
| Disallow sequential characters | No/Yes/Yes, case insensitive | <p>Disallows the use of successive characters in an alphabetical order.</p> <p>If this option is set to No, sequential characters are allowed. This is the default value.</p> <p>If this option is set to Yes, sequential characters in a different case are considered as non-sequential. For example, a and b and non-sequential.</p> <p>If this option is set to Yes, case insensitive, sequential characters in different cases is disallowed.</p> |
| Begin with an uppercase character | No/Yes | <p>This parameter requires a password to start with an uppercase character.</p> <p>The default value is No.</p> <p>If this option is set to Yes, all other policies that indicate that a password must begin with a particular character or in a specific manner are disabled.</p> <p>IMPORTANT: Only one type of character can be designated as the first value of a password.</p> |
| End with an uppercase character | No/Yes | <p>Enforces the use of an uppercase letter at the end of a password.</p> <p>The default value is No.</p> <p>If this option is set to Yes, all other policies that indicate that a password must end with a particular character or in a specific manner are disabled.</p> |
| Prohibited characters | Keyboard characters | <p>Defines a list of characters that cannot be used in a password.</p> <p>NOTE: There is no need of a separator in the list of prohibited characters. For example, @#\$\$%&*</p> |
| Begin with any Alpha character | No/Yes | <p>This parameter requires a password to start with an alphabetical letter that is, [a-z] or [A-Z].</p> <p>The default value is No.</p> <p>If this option is set to Yes, it automatically disables all other policies that specify what the first character of the password should be.</p> |

| Policy | Value | Description |
|-------------------------------------|--------|--|
| Begin with any number | No/Yes | Enforces the use of a numeric character as the first character of the password. The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the first character of the password should be. |
| Begin with any symbol | No/Yes | This parameter requires a password to start with a symbol. These characters are: ~!@#\$\$%^&*()_+ =\\{}[]:\\"; '<>?/,.'` The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the first character of the password should be. |
| End with any Alpha character | No/Yes | Enforces the use of an alphabetic character as the last character of the password. The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the password should end with. |
| End with any number | No/Yes | Enforces the use of a numeric character as the last character of the password. The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the password should end with. |
| End with any symbol | No/Yes | This parameter requires a password to end with a symbol. These characters are: ~!@#\$\$%^&*()_+ =\\{}[]:\\"; '<>?/,.'` The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the password should end with. |

7.3 Creating a New Password Policy

- 1 Access the Administration Management Utility.
- 2 Click **Password Policies**. The Password Policies page is displayed.
- 3 Click **New**. The New Password Policy dialog box is displayed.

It is important to use a unique name for all logins, applications, and password policies. Password policies cannot have the same name as any other SecureLogin attribute. Typically, organizations employ the naming convention ApplicationNamePwdPolicy, for example, LotusNotesPwdPolicy.

- 4 In the **Enter a name for the new password policy** field, specify a name for the policy. The new policy is added under the Password Policies.
- 5 Click **OK**. The new password policy is added.
- 6 Click the new password policy. The Password policy properties table is displayed.
The table contains **Description** and **Value** columns. Most policy rules are not enforced and do not have a default value. Values are either **Yes**, **No**, or a whole number.
- 7 In the **Description** column, locate the policy you want to change, then either select the appropriate value from the drop-down list or enter the required text field values in the adjacent **Value** column.
- 8 Click **Apply** to save changes.
- 9 Click **OK** to close the Administrative Management utility.

IMPORTANT: Password policies are linked to applications by using the SecureLogin application definition command `RestrictVariable`. You can use this command to apply password policies to one or more applications.

7.4 Linking a Policy to an Application

You can set or select a password policy, while enabling applications for single sign-on using the application definition wizard. You can also link the password policies to applications by using the SecureLogin application definition command `RestrictVariable`. With this command, you can apply the password policies to one or more applications, as in the example below.

The following definition restricts the `$Password` variable to the Finance password policy. The user's password must match the policy when he or she saves the credentials. When the password requires changing, the application generates a new password based on the policy randomly because `Random` is included in the definition at `ChangePassword`.

```
# Set the Password to use the Finance Password Policy
RestrictVariable $Password FinancePwdPolicy
# Login Dialog Box
Dialog
  Class #32770
  Title "Login"
EndDialog
Type $Username #1001
Type $Password #1002
# Change Password Dialog Box
Dialog
  Class #32770
  Title "Change Password"
EndDialog
Type $Username #1015
Type $Password #1004
ChangePassword $Password Random
Type $Password #1005
Type $Password #1006
Click #1
```

The following example uses an application definition to restrict the `?NewPwd` variable to the Finance password policy. The user's current password (`$Password`) is saved and used when the application starts for the first time and prompts the user to enter the credentials. When the password expires, the password policy is enforced on any new password.

```
# Set the Password to use the Finance Password Policy
RestrictVariable ?NewPwd FinancePwdPolicy
# Log on Dialog Box
Dialog
Class #32770
Title "Log on"
EndDialog
Type $Username #1001
Type $Password #1002
Click #1
# Change Password Dialog Box
Dialog
Class #32770
Title "Change Password"
EndDialog
Type $Username #1015
Type $Password #1004
ChangePassword ?NewPwd Random
Type ?NewPwd #1005
Type ?NewPwd #1006
Set $Password ?NewPwd
Click #1
```

8

Managing Smart Card Integration

Network authentication is the verification of a user's login credentials before granting access to a network or operating system. Users typically authenticate to a network using one of the following methods:

- ◆ Password
- ◆ Biometric device (fingerprint or iris scan)
- ◆ Smart card and PIN
- ◆ Token

When a user authenticates successfully and the operating system loads, SecureLogin starts and manages the login credentials to the user's single sign-on-enabled applications.

If you want to enforce biometric, smart card, or token authentication at the application (or transaction) level, `AAVerify` can be used with SecureLogin to prompt the user to re-authenticate before SecureLogin retrieves their credentials and logs in to single sign-on enabled applications.

You can also integrate network authentication methods such as ActivIdentity's SCPL with SecureLogin to manage user's Windows login credentials (user name, password, and network selection). SCPL provides secure and convenient network log in by allowing a user to simply insert the smart card and enter the PIN to gain network access. SCPL retrieves the user's Windows username and password from the smartcard and automatically enters these into the Windows Graphical Identification and Authorization (GINA)/Credential Provider interface after a user enters his or her PIN.

The use of a smart card with SecureLogin is based on the enterprise preference to have users utilize a smart card to log on and store their single sign-on data or to encrypt their directory data using a Public Key Infrastructure (PKI).

To continue working with SecureLogin, you must manually add the entry and set the value to File.

The secondary store entry under `HKLM/Protocom/SecureLogin/Security` is deleted when the installer is modified to remove smart card support. To continue working with SecureLogin, you must manually add the entry and set the value to File.

If you are using smart card authentication for the Citrix login prompt, enter the smart card PIN manually, because the PIN is not cached for the Citrix server authentication.

This section provides information about the following:

8.1 How SecureLogin Uses Smart Cards

- ◆ [Section 8.1.1, “Prerequisites,” on page 62](#)
- ◆ [Section 8.1.2, “Using Smart Card to Log In to Workstation,” on page 62](#)
- ◆ [Section 8.1.3, “Strong Authentication Methods,” on page 62](#)

8.1.1 Prerequisites

SecureLogin supports ActivClient 6.x and 7.x, and Microsoft BaseCSP MiniDriver only. ActiveClient 6.2 is supported on 32-bit and 64-bit system on all platforms.

To enable smart card support with SecureLogin, the **Use smart card** option must be selected during installation, regardless of the administrator’s intended preferences for setting the SecureLogin security preference **Require smart card is present for SSO and administration operations**.

IMPORTANT: Contact NetIQ Support for information about other cryptographic service providers.

See [Installing SecureLogin for Smart Cards](#) for more information about enabling smart card support during installation and deployment.

NOTE: When you use eDirectory to create a certificate for a smart card user, ensure that the key usage options **Digital Signature** and **Key Encipherment** are selected.

8.1.2 Using Smart Card to Log In to Workstation

SecureLogin allows a user to alternate their log in method by using smart card.

However, a user can only log in by using a smart card to access the SecureLogin credentials only if the smart card option is selected during installation.

If the smart card option is not selected during installation, a user attempting to access SecureLogin on the workstation is forced to log in with his or her username and network password.

8.1.3 Strong Authentication Methods

- ◆ [“Advanced Authentication” on page 63](#)
- ◆ [“One Time Password” on page 65](#)
- ◆ [“Smart Card Password Login” on page 66](#)
- ◆ [“Smartcard Application Reauthentication” on page 66](#)

Advanced Authentication

SecureLogin uses the `AAVerify` script command to enforce strong security for applications that cannot provide such a mechanism natively. `AAVerify` can also be implemented to provide user authentication to applications that have no existing authentication interface. Use this command in conjunction with NetIQ Advanced Authentication Framework or NetIQ Modular Authentication Services (NMAS) to force users to log in to the configured application with a smartcard.

For details of the `AAVerify` application definition command, see the [NetIQ SecureLogin 9.1 Application Definition Guide](#).

- ◆ [“New Functionality in the `AAVerify` Command” on page 63](#)
- ◆ [“The New `?IsPin` Variable” on page 63](#)
- ◆ [“Recommended Configuration” on page 64](#)
- ◆ [“Example Application Definition” on page 64](#)
- ◆ [“Reauthenticating a Predefined Web Application” on page 65](#)

New Functionality in the `AAVerify` Command

The existing version of the `AAVerify` command relies on NMAS. Any NMAS supported method, such as smartcard, can be deployed in the backend to process any re-authentication requests. In Active Directory environments, this support is provided by NetIQ Advanced Authentication Framework.

The `AAVerify` command provides a secure method to re-authenticate users. Thus proving the users identity before injecting the SecureLogin credentials into sensitive applications.

To process the reauthentication request, the `AAVerify` command takes the method by which users are currently logged in and their directory connectivity status.

If users have logged in with a username and password, they are prompted to reauthenticate by using the password, regardless of whether they are offline or online.

If users have logged in with a smart card, they are prompted to reauthenticate by using the original smart card PIN, regardless of whether they are offline or online.

`AAVerify` is independent of NMAS and can be used to enforce strong re-authentication by using a smart card and PIN or password without installing NMAS.

This command caters to a mixed environment where one of the following conditions exists:

- ◆ A user logs in to a number of workstations by using a combination of both smart card or password authentication
- ◆ Several users log in to one workstation by using smart card or password authentication.

The New `?IsPin` Variable

`?IsPin` is a new SecureLogin variable available in the Microsoft Active Directory mode only.

This variable is automatically generated when a user logs in. It stores the information based on whether the user has logged in to the workstation by using a smart card and PIN or a password.

When the `?IsPin` variable is called from an application definition, it indicates the following:

- ♦ If the returned value is true, the user has logged in by using a smart card, and only the PIN value is passed through to SecureLogin.
- ♦ If the returned value is false, the user has logged in with a password.

NOTE: The `?IsPin` variable is updated only at a login and is not updated at a screen unlock.

Recommended Configuration

Use smart card option is normally based on your preference to have the SecureLogin users utilize a smart card to store the single sign-on data or to encrypt their user's directory data by using a PKI.

If you decide to allow users to log in to their workstations by using a smart card and reauthenticate against their smart card, then **Use smart card option** must be selected during the installation regardless of the option set for **Require smart card is present for SSO and administration operations**.

NOTE: It is recommended to use a smart card configuration policy to lock the screen on card removal to ensure that the smart card belongs to the currently logged-in user.

Example Application Definition

The following application definition shows how to call the `AAVerify` command based on the login method. It uses the Notepad application. After the Notepad application is started, `AAVerify` is invoked to prompt the user to reauthenticate, using the login method for the workstation.

```
Dialog
Class Notepad
EndDialog

OnException AAVerifyFailed Call AAVerifyFailed
OnException AAVerifyCancelled Call AAVerifyCancelled

If ?isPin Eq "true"
  AAVerify -method "smartcard" ?result
Else
  AAVerify -method "password" ?result
EndIf
ClearException AAVerifyFailed
ClearException AAVerifyCancelled
Type $username
Type \n
Type $password
Type \n
Sub AAVerifyFailed
  MessageBox "Reauthentication failed."
  EndScript
EndSub

Sub AAVerifyCancelled
  MessageBox "Reauthentication cancelled."
  EndScript
EndSub
## EndSection: "Login Window"
```

Reauthenticating a Predefined Web Application

If the new `AAVerify` command is used to reauthenticate a Web browser-based application or if the **Prompt for device authentication for this device** option is enabled for Web applications, then the predefined application definition for the Web browser must be applied for that particular user to avoid confusion when prompting for reauthentication.

One Time Password

The use of multiple passwords places high maintenance overheads on large enterprises. This results in significant cost where users use and manage multiple logins. The calls to helpdesk to reset forgotten password, providing all password when a new employee joins, or deleting the logins when an employee quits can be high in cost.

A one time password (OTP) reduces the cost, particularly with regard to calls to the help desk to reset a forgotten password, or to ensure that all passwords are provisioned when a new user starts, or deleted when existing user leaves the organization.

SecureLogin integrates with ActiveIdentity's one time password authentication functionality and provides you access to the `GenerateOTP` application definition command, which can be used to generate synchronous authentication and asynchronous authentication soft token support for smart card user authentication.

If you are using One Time Password capability on 32-bit applications running on 64-bit operating system in the Active Client 7.x environment, set the following registry keys:

| Location | Type | Name |
|--|--------|---|
| HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin\Security\ | String | StorageDeviceInterfaceLibraryPKCS11-Wow64 |

| Set to: | Explanation |
|---|---------------------|
| C:\Program Files (x86)\HID Global\ActivClient\acpkcs211.dll | Path to ActivClient |

| Location | Type | Name |
|--|--------|---------------------------------------|
| HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin\Security\ | String | StorageDeviceInterfaceLibraryPKCS11-2 |

| Set to: | Explanation |
|---|---------------------|
| C:\Program Files\HID Global\ActivClient\acpkcs211.dll | Path to ActivClient |

| Location | Type | Name |
|--|--------|-------------------------------------|
| HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin\Security\ | String | StorageDeviceInterfaceLibraryPKCS11 |

| Set to: | Explanation |
|---|---------------------|
| C:\Program Files\HID Global\ActivClient\acpkcs211.dll | Path to ActivClient |

Smart Card Password Login

ActivIdentity's Smart Card Password Login (SCPL) provides smart card-based Windows login that is not PKI-based. SCPL, when used in conjunction with SecureLogin, stores and manages a user's Windows login and SecureLogin credentials. It provides efficient network login by allowing a user to simply insert their smart card and enter their PIN.

Smartcard Application Reauthentication

You can configure SecureLogin to reauthenticate an application using the SecureLogin Administrative Management Utility or application definition wizard. To use this, enable **Prompt for device re-authentication for this application** and configure the **Re-authentication method**.

IMPORTANT: `Basecsp.dll` supports only smart card authentication. It does not support smart card re-authentication even in Kiosk mode. To allow re-authentication, use `acpkcs.dll`.

For more information, see [Chapter 11, "Reauthenticating Applications," on page 89](#).

8.2 Installing SecureLogin for Smart Cards

- ◆ [Section 8.2.1, "Client Setup," on page 66](#)
- ◆ [Section 8.2.2, "Server Side Administration Preferences," on page 67](#)
- ◆ [Section 8.2.3, "Minimum Requirements," on page 67](#)
- ◆ [Section 8.2.4, "Supported Configurations," on page 67](#)

8.2.1 Client Setup

During the installation of SecureLogin the smart card option can be selected by the administrator to enable a SecureLogin user to utilize a smart card to encrypt their directory data using a Public Key Infrastructure (PKI) token.

Existing ActivClient smart card settings are used by SecureLogin if they are detected unless the administrator chooses otherwise.

The administrator can optionally select an alternative cryptographic service provider (Microsoft Crypto API) from a drop-down list. SecureLogin supports ActivClient, and Microsoft BaseCSP MiniDriver smart card middleware. Contact NetIQ Support if your organization uses any other cryptographic service provider.

8.2.2 Server Side Administration Preferences

SecureLogin is a highly configurable and flexible product, with numerous preferences and options, that allow the system administrator to implement and enforce corporate directory policy across an enterprise.

Corporate policies may include, but are not limited to, enabling strong application security, how SSO data is encrypted and stored, how password and passphrase policies are implemented and enforced, and setting of management procedures for lost smart card scenarios.

In the case of strong security requirements, administrators should be fully aware of the implications of linking the use of SecureLogin to a smart card and disabling the passphrase functionality.

Various combinations and permutations of configuring SecureLogin for use with smart cards are covered in following sections.

8.2.3 Minimum Requirements

For information about the minimum requirements for using smart cards with SecureLogin, see the [SecureLogin 9.1 Installation Guide](#) for your directory environment.

8.2.4 Supported Configurations

SecureLogin supports the following smart card middleware:

- ◆ ActivClient 6.x and 7.x
- ◆ Microsoft BaseCSP MiniDriver

NOTE: SecureLogin might work with other smart card vendor middleware but those are not tested and are not supported.

While installing SecureLogin with smart card option selected, select the appropriate cryptographic service provider and PKCS#11 dynamic link library file path. If the appropriate version of PKCS#11 library file is not present during installation, SecureLogin installs without smart card support. However, if a required library file is missing errors can occur.

For example, if the PKCS#11 wrapper library file `aetpkkse.dll` is missing, the `Access to smart card failed` message is shown when Access Manager attempts to access the smart card. To avoid this error, ensure that the `aetpkkse.dll` file is available at `C:\WINDOWS\system32\`.

PKCS 11 Library Path

| Smart Card Middleware | PKCS 11 Library path |
|--------------------------------------|---|
| ActivClient 6.2 | C:\Program Files\ActivIdentity\ActivClient\acpkcs211.dll |
| ActivClient versions previous to 6.2 | C:\Windows\System32\acpkcs211.dll |

If smart card middleware is installed after SecureLogin is installed, the registry key settings for cryptographic service provider and PKCS#11 dynamic link library file path must be changed manually; to activate smart the card support, uninstall or re-install SecureLogin.

NOTE: Manually configuring a third-party smart card PKCS #11 link library assumes a high level of understanding of the crypto-graphic service provider's product. System administrators are encouraged to use the ActivClient smart card support with SecureLogin whenever possible.

For more information about installing SecureLogin for use with smart cards and cryptographic tokens, see the [SecureLogin 9.1 Installation Guide](#) for your directory environment.

8.3 Configuring SecureLogin for Smart Cards

No two organizations have the same environment and requirements. SecureLogin includes a number of options that determine SecureLogin's behavior, such as how single sign-on data is encrypted (that is, using the smart card or a passphrase question and answer) and how to handle scenarios such as lost cards.

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Preferences**.
- 3 In the **Setting Description** column, go to **Security** and select the appropriate preferences.
- 4 Click **Apply > OK**.

Using AES for SSO Data Encryption

This option determines the level and standard of encryption used to encrypt single sign-on data stored on the smart card by allowing the use of AES instead of triple DES.

If you select **No**, a 168-bit key used with triple DES (EDE) in Cipher-Block Chaining (CBC) mode is used to encrypt the user's single sign-on credentials.

NOTE: The input key for DES is 64 bits long and includes 8 parity bits. These 8 parity bits are not used during the encryption process, resulting in a DES encryption key length of 56 bits. Therefore, the key strength for Triple DES is actually 168 bits.

If you select **Yes**, a 256-bit key used with AES (EDE) in the CBC mode is used to encrypt the user's credentials.

If a previous version of SecureLogin has been implemented with passphrases enabled and if this option is set to **Yes**, users must answer with a passphrase before data can be decrypted and reencrypted by using AES.

8.4 Using PKI Encryption for the Datastore and Cache

If PKI credentials are used to encrypt SecureLogin data with the passphrase security system off (set to **No**), you should consider implementing a key archive/backup and recovery. If key archive/backup and recovery is not implemented and the passphrases security system is not enabled, the users can never decrypt their SecureLogin data if they lose their smart card because the private key is stored on the lost smart card.

Without private key recovery, you have to clear the user's SecureLogin data store before they can use SecureLogin again. This is a high security solution but is inconvenient to end users as they cannot access SecureLogin without the smart card.

- ♦ [Section 8.4.1, “Choosing a Certificate,” on page 69](#)
- ♦ [Section 8.4.2, “Certificate Selection Criteria,” on page 70](#)
- ♦ [Section 8.4.3, “Current Certificate,” on page 70](#)

8.4.1 Choosing a Certificate

When a smart card is configured to use PKI credentials to encrypt single sign-on data, SecureLogin retrieves the serial number of the current certificate and locates the certificate in the certificate store as specified in the relevant SecureLogin preferences. SecureLogin then loads the associated private key and attempts to decrypt the user key with the private key.

If the decryption fails or the certificate is not located, a smart card is present, and a certificate that matches the selection criteria is not located, then SecureLogin assumes that a recovered smart card is in use. It then attempts to decrypt the user key with each key pair stored on the card.

IMPORTANT: If you are using PKI encryption and the certificate selection criteria depends on the certificate's friendly name, you will need to disable Microsoft certificate propagation.

Because the windows certificate propagation method does not propagate the certificate friendly name, you cannot successfully start SecureLogin.

To disable the Microsoft certificate propagation, set the registry key value to 0.

1. On the Windows **Start** menu, click **Start > Run** to display the Run dialog box.
 2. Type `regedit` then click **OK** to open the Registry Editor.
 3. Browse to the `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon\Notify\ScCertProp`
 4. Create a DWORD Value named Enabled.
 5. Set the value of the DWORD to 0.
 6. Exit the Registry Editor.
-

8.4.2 Certificate Selection Criteria

The Certificate Selection Criteria preference allows you to select an encryption or authentication certificate to encrypt the user's single sign-on information in the directory.

The certificate selection criteria determines which certificate to select if multiple certificates are in use (for example, if an enterprise has configured an Entrust certificate for single sign-on encryption and a Microsoft certificate for login and or, authentication).

If only one certificate is used, the field is blank and the certificate is detected automatically and set to **User Certificate**. When entering certificate selection criteria, no special formatting is required and the search string is not case sensitive. Wildcards are not used and a search matches if the search text is a substring of the certificate subject field. SecureLogin attempts to match against certificate subject, issuer, and friendly name in the following order:

1. Certificate Subject
2. Certificate Issuer
3. Friendly Name

Example 8-1 For example if the subject is

```
CN=Writer,OU=Users,OU=Accounts,OU=APAC,DC=Novell,DC=Int
```

Then *Writer* is a valid search value, as are *Accounts*, *APAC*, and *Int*. The prefixes *CN=*, *OU=*, or *DC=* are not required.

Similarly, if the **Certificate Issuer** is

```
CN=IssuingCA1,OU=AD,DC=undiscovered,DC=com
```

Then *IssuingCA1* is a valid search value, as are *AD*, *undiscovered*, and *com*.

8.4.3 Current Certificate

This preference displays the certificate that is currently being used by SecureLogin to encrypt a user's single sign-on data.

8.5 Lost Card Scenarios

- ♦ [Section 8.5.1, “Lost Card Scenario Preference,” on page 71](#)
- ♦ [Section 8.5.2, “Requiring a Smart Card,” on page 71](#)
- ♦ [Section 8.5.3, “Allowing a Passphrase,” on page 72](#)
- ♦ [Section 8.5.4, “Passphrases for Temporary Access,” on page 72](#)
- ♦ [Section 8.5.5, “Using a Card Management System,” on page 72](#)

8.5.1 Lost Card Scenario Preference

The Lost Card Scenario preference determines how SecureLogin handles a user forgetting, losing, or damaging a smart card. The Lost Card scenario preference can only be used if, the Enable passphrase security system preference is also enabled (set to either Yes or Hidden).

NOTE: For users upgrading from SecureLogin version 5.5, setting **Enable passphrase security system** to **Hidden** is equivalent to setting the old **Disable passphrase security system** to **Off**.

If a smart card is used to encrypt single sign-on data and the card is lost, stolen, or damaged. Also, if the key archive/backup and recovery is not used, the user will not have access to their single sign-on data unless the Enable passphrase security system preference is set to Yes or Hidden.

- ◆ If Enable passphrase security system is set to Yes, the user has previously set a passphrase, and Lost card scenario is set to Allow Passphrase, then the user is prompted to answer with his or her passphrase before SecureLogin is available.
- ◆ If **Enable passphrase security system** is set to **Hidden**, the user is not prompted for the answer and SecureLogin loads seamlessly.

Allow Passphrase

This preference allows the user to start SecureLogin using their passphrase if their smart card is not available. The **Enable passphrase security system** preference must be set to Yes or Hidden for this to work. Hidden replaces a user-generated passphrase with a system-generated passphrase, effectively removing the need for the user to remember the passphrase answer.

IMPORTANT: For the user to decrypt data using their passphrase, the passphrase must already have been set. Administrators cannot simply toggle the **Enable passphrase security system** preference on the day the user forgets their smart card unless the user has previously set a passphrase (or had it randomly generated using Hidden).

NOTE: Administrators can manually disable inheritance of higher-level preferences by selecting **Yes** in **Stop walking here** in SecureLogin Administrative Management Utility > Preferences > General.

Default

The default preference is to allow the user to start SecureLogin using their passphrase, unless it inherits a **Lost card scenario** preference from a higher-level container.

8.5.2 Requiring a Smart Card

The **Require smart card** preference prevents users from starting single sign-on without their smart card. This option is for high security implementations where organizations want to tie the user's single sign-on credentials to the user's smart card. The user cannot single sign-on using the username and password without the smart card.

IMPORTANT: If the **Require smart card** option is changed while the user is logged in, refreshing the cache using the **Advanced > Refresh Cache** option from the taskbar does not refresh **Lost card scenario**.

The user must log out and log in again (or restart SecureLogin) for the new option to take effect.

8.5.3 Allowing a Passphrase

The **Allow passphrase** preference must be used in conjunction with the **Enable passphrase security system** option. It allows the user to start SecureLogin by using a passphrase if the smart card is not available. The passphrase security system must be set to **Yes** or **Hidden** for this setting to apply.

The **Hidden** option replaces a user-generated passphrase with a system-generated passphrase, effectively removing the need for the user to remember the passphrase answer.

IMPORTANT: For the user to decrypt data using a passphrase, the passphrase must already be set. You cannot simply toggle the **Enable passphrase security system setting** to on the day the user forgets a smart card unless the user has previously set a passphrase (or had it randomly generated by using the **Hidden** option).

The **Default** option allows the user to start SecureLogin by using a passphrase if the smart card is not available through the **Allow Passphrase** preference. Alternatively, this option inherits the **Lost Card scenario** preference set by the higher-level container.

You can manually disable inheritance of higher-level options by selecting the **Yes** option for **Stop walking here** (SecureLogin Administrative Management utility > **Preferences > General** options.)

8.5.4 Passphrases for Temporary Access

There is another option available that permit access if a user loses or forgets his or her smart card. For example, if a user loses or forgets his or her smart card and the **Lost card scenario** option is set to **Require smart card**, you can grant temporary access to systems by resetting the user's password. The user is then required to log in and enter the passphrase. This option is possible only if the **Enable passphrase security system** is turned on.

However, the user should not expect easy or automatic access to the system. Users should understand that, a strong and secure solution has been implemented and that they have the responsibility of looking after their own smart cards.

8.5.5 Using a Card Management System

Enterprise server or web-based card management system (CMS) software enables corporations to implement and easily manage smart card-based identity management, provisioning, and authentication devices and enforce policy across geographically-dispersed locations.

These systems provide a complete and flexible solution to manage the issuance, administration, and configuration required for the successful and seamless smart card integration.

NetIQ CMS provides a complete and flexible solution to manage the issuance, administration and configuration required for a successful and seamless smart card integration with SecureLogin and Smart Card Password Login (SCPL). It can be configured to perform key escrow, archive and recovery as described throughout this document.

- ♦ [“Restoring a Smart Card Using Card Management System” on page 73](#)
- ♦ [“Accessing Without a Card Management System” on page 73](#)
- ♦ [“PKI Credentials” on page 74](#)
- ♦ [“Key Generated on Smart Card” on page 74](#)

Restoring a Smart Card Using Card Management System

The use of a CMS is crucial if an enterprise opts to deploy corporate smart cards with a very high level of security. This would include disabling the Enable passphrase security system preference combined with Store credentials on smart card (set to Yes) and Use smart card to encrypt SSO data (set to PKI credentials or Key generated on smart card).

In the event of a lost or damaged smart card, the user can never decrypt their single sign-on data because the key stored on the smart card is not recoverable.

You must then reset the user's corporate passwords and issue a new smart card (with a new key pair) before the user can log in and reconfigure the single sign-on applications using SecureLogin again.

The user must manually enter all application credentials into SecureLogin the first time he or she logs in after the data was cleared from the directory.

Enterprises should consider implementing key escrow, archiving, or backup through a suitable CMS to allow a user's encryption key to be recovered in the event of a lost or damaged smart card.

It is recommended that you extensively test the CMS and smart card restoration techniques before selecting the high security options described above.

The procedure to reset a user's data store is described in [Deleting or Re-setting User Data](#).

Accessing Without a Card Management System

If an enterprise opts to deploy corporate smart cards without a suitable card management system (CMS), you can still create a very high level of security by setting Enable passphrase security system to No and then selecting the Use smart card to encrypt SSO data preference to PKI credentials or Key generated on smart card. However, in the event of a lost or damaged smart card the user can never decrypt the single sign-on data because the key stored on the smart card is not recoverable.

WARNING: Deleting the user's single sign-on datastore permanently deletes the users data in the directory. This would include any local applications, credentials, preferences, and password policies that are not being inherited from some other object in the directory.

If you still decide to delete the user's existing single sign-on configuration data store, delete it from the Advanced Setting > Datastore tab of the user object in the directory management tool.

The administrator must then reset the user's corporate password and issue a new smart card (with a new key pair) before the user can log on and reconfigure their single sign-on enabled applications.

The user will have to re-enter all their application credentials into SecureLogin the first time it is used after having them deleted from the directory.

PKI Credentials

If the Use smart card to encrypt SSO data preference is set to PKI credentials and Enable passphrase security system is set to No, then in the event of a lost or damaged smart card the user will never be able to decrypt the single sign-on data because the key stored on the smart card is the only key that can be used for decryption. This key is not recoverable unless key archiving and recovery was implemented.

If a CMS-based key archive is used, then the encryption key needs to be recovered to the new smart card, the single sign-on data unencrypted, and an administrator needs to chose a new certificate to encrypt the user's data.

If you are using the enterprise CMS-based recovery system, you must issue the user a replacement smart card based on a CMS backup of the user's original key.

Key Generated on Smart Card

Similarly, if the Use smart card to encrypt SSO data preference is set to use Key generated on smart card, then in the event of a lost or damaged smart card the user can never decrypt the single sign-on data because the key stored on the smart card is not recoverable.

You should consider setting the **Enable passphrase security system** option to **Yes** when the **Key generated on smart card** option is used to provide an alternative mechanism for decrypting single sign-on data if the smart card is lost/stolen/damaged.

Using the enterprise CMS-based recovery system, the administrator must issue the user a replacement smart card based on a CMS backup of the user's original key. The replacement card includes the recovered private key and a new key pair so data can be decrypted using the old key and re-encrypted using the new key.

8.6 Smart Card with DAS Integration

With SecureLogin, you can enable users to log in to SecureLogin separately by using the smart card credentials

- 1 On the Windows desktop, click **start > Run** to display the Run dialog box.
- 2 Enter `regedit`, then click **OK** to open the Registry Editor.
- 3 Browse to the `HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin\NSLADAuth`.
- 4 Create `DWORD NSLADAuth` and set the value of `NSLADAuth` to `1`.
- 5 Exit the Registry Editor.
- 6 Log out from the workstation and log in again.
- 7 Launch the SecureLogin.

This feature can be effectively used for Desktop sharing using DAS. To enable smart card with DAS you have to use `on-cardmon` and `card-insert` elements.

This feature enable users to log in by using the Smart Card credentials in Desktop Automation Services, the `on-cardmon` element is modified. The `card-insert` and `LoginAction` attributes are added to the `on-cardmon` element. For more information, see [on-cardmon](#).

8.6.1 Fast user switch using Smart Card in Active Directory Mode

The changes in smart card and Desktop Automation Services allow for switching of users using a smart card in Active Directory mode.

- 1 Log in to the workstation where you want to launch SecureLogin.
- 2 Configure `actions.xml` to hide and unhide the desktop using the smart card fast user switch.
- 3 Insert the smart card.

The SecureLogin PinPrompt dialog box is displayed prompting you to enter a valid PIN.

- 4 Enter the valid PIN.

SecureLogin is launched successfully for the smart card user.

8.7 Disconnected Login using NESCM

With this feature enabled, LDAPAuth encrypts and stores the Windows workstation or the AD domain user password locally and retrieve it when required, hence the user need not re-enter the workstation password from the next login onwards.

With NESCM as the login method, this feature is supported in the LDAP Gina or Credential Provider mode with eDirectory. When logging in with NESCM in either online or offline mode, just entering the PIN is sufficient.

8.7.1 Registry Settings

To enable Disconnected Login using NESCM, create the following registry settings:

| Registry Path | Registry Type | Registry Name | Registry Value |
|--|---------------|-------------------------|---------------------|
| HKEY_LOCAL_MACHINE\SOFTWARE\Novell\Login\LDAP | DWORD | DisconnectedRequired | 1 |
| | DWORD | LDAPAuthNMASSelected | 1 |
| | DWORD | UsePasswordFieldforNMAS | 1 |
| | String | LDAPAuthNMASSequence | Enhanced Smart Card |
| HKEY_LOCAL_MACHINE\SOFTWARE\Pr otocom\SecureLogin | DWORD | DoNotShutdownNSL | 1 |
| | DWORD | TryRegCredInOffline | 1 |

8.8 SecureLogin in Kiosk Mode

In the Active Directory mode, by default SecureLogin uses the workstation logged in session to login to SecureLogin. User can also login to SecureLogin using different credentials by updating the registry setting:

- 1 On the Windows desktop, click **start > Run** to display the Run dialog box.
- 2 Enter `regedit`, then click **OK** to open the Registry Editor.
- 3 Browse to the `HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin\NSLADAuth`.
- 4 Create `DWORD NSLADAuth` and set the value of `NSLADAuth` to `1`.
- 5 Exit the Registry Editor.
- 6 Log out from the workstation and log in again.
- 7 Launch the SecureLogin.

This feature can be effectively used for desktop sharing using DAS. To enable smart card with DAS you have to use `on-cardmon` and `card-insert` elements. For more information about these new attributes, see [“on-cardmon” on page 155 in Administering Desktop Automation Services](#).

NOTE: This feature is not supported with SecureLogin installed in the ADAM mode.

8.8.1 Kiosk Mode Using Smart Card

The changes in smart card and Desktop Automation Services allows switching of users using smart card in Active Directory mode.

- 1 Log in to the workstation where you want to launch SecureLogin.
- 2 Insert the smart card and Launch SecureLogin.
- 3 Enter the valid PIN.

The SecureLogin is launched successfully for the smart card user.

8.8.2 Kiosk Mode Without Using Smart Card

If the user's smart card is invalid or not present, then they can login to SecureLogin with a different credential.

- 1 Log in to the workstation and launch the SecureLogin.
- 2 Enter the valid credentials

The SecureLogin client is launched successfully.

NOTE: If the Active Directory user password is expired, user has to change the password through the Windows settings before logging in to Novel SecureLogin. In this case, SecureLogin will not prompt the user to change an expired password.

8.9 Enable Pin Caching for Smart Card

To enable pin caching for smart card, update the registry settings as follows:

- 1 Browse to `HKEY_LOCAL_MACHINE\Software\Protocom\SecureLogin`.
- 2 Create a new `DWORD` value `EnableSmartCardPinCache`.
- 3 Set this value to 1.

8.10 Changing Smart Card Login Password on Expiry

In the eDirectory mode, when a user logs in using NESCM (Novell Enhanced Smart Card Method) and the user password is expired, SecureLogin detects the expired password and changes automatically on behalf of the logged in user. To enable this, update the registry settings:

- 1 Browse to `HKEY_LOCAL_MACHINE\Software\Protocom\SecureLogin`.
- 2 Create a new `DWORD` value `ChangePasswordOnExpiry`.
- 3 Set this value to 1.

NOTE: This feature is supported only with SecureLogin installed in eDirectory Novell Client mode without selecting **Novell SecretStore Client**.

The `ChangePasswordOnExpiry` feature does not work with complex eDirectory password policy settings in SecureLogin.

9 Support for Windows Hello for Business

Windows Hello for Business replaces passwords with multi-factor authentication on users' devices. It consists of an authentication method that is tied to the device and uses a biometric or PIN. SecureLogin supports integrating Windows Hello for Business. After the integration, you can use the Windows Hello for Business method to protect the SecureLogin icon and reauthenticate applications.

SecureLogin can access the datastore using a biometric or PIN. When Windows Hello for Business is configured in your environment, SecureLogin provides users a seamless single sign-on experience to their devices.

NOTE: If you want to change the login method from password to Windows Hello for Business or vice versa, you must provide the passphrase to update the login method.

For more information about Windows Hello for Business, see [Windows Hello for Business](#).

For information about system requirements, see [Section 9.1, "System Requirements for Windows Hello for Business," on page 79](#)

Using Windows Hello for Business with SecureLogin, you can achieve the following goals:

- ♦ Access user data store using biometric or PIN.
- ♦ Protect the SecureLogin icon. See [Protecting the SecureLogin Icon by Using Windows Hello for Business](#).
- ♦ Reauthenticate users. See [Reauthenticating Users by Using Windows Hello for Business](#).

IMPORTANT: To use Windows Hello for Business, ensure that AES is configured for the data encryption. The Triple DES encryption is not supported for Windows Hello for Business.

9.1 System Requirements for Windows Hello for Business

This section provides the minimum requirements for Windows Hello for Business to work with SecureLogin.

Table 9-1 System Requirements

| | |
|------------|--|
| Directory | <ul style="list-style-type: none">♦ Active Directory♦ Active Directory Lightweight Directory Services |
| Deployment | <ul style="list-style-type: none">♦ On-premise♦ Hybrid |
| Encryption | <ul style="list-style-type: none">♦ AES |

| | |
|---------------------|---|
| Methods | <ul style="list-style-type: none">◆ PIN◆ Biometrics |
| Security Preference | <ul style="list-style-type: none">◆ Set Use AES for SSO data encryption to Yes◆ Set Use Windows Hello to encrypt SSO data to Yes |

9.2 User Data Migration from 3DES to AES Encryption

Perform the following steps to migrate the user data from 3DES to AES encryption for SecureLogin to work seamlessly:

- 1 Login as an administrator to the client machine where **SLManager** is installed.
- 2 Navigate to the user profile either by providing the object domain name or by browsing the navigation tree.
- 3 Validate that the **Use AES for SSO data Encryption** security preference is set to **Yes**.
- 4 Login as the user in the Windows client machine. If the user is already logged in, log off and re-login.

9.3 Protecting the SecureLogin Icon by Using Windows Hello for Business

Instead of protecting the SecureLogin icon with the network password, you can use Windows Hello for Business to protect the SecureLogin icon. Perform the following steps:

- 1 Click **Preferences > General**.
- 2 Select **Yes** for **Password protect the system tray icon**.
- 3 Click **Apply > OK**.

9.4 Reauthenticating Users by Using Windows Hello for Business

You can configure Windows Hello for Business to reauthenticate users. Users can then use biometric or PIN to reauthenticate to the application. You can configure the Windows Hello method for reauthentication in one of the following ways:

- ◆ [Using the Administrative Management Utility](#)
- ◆ [Using the Application Definition Wizard](#)
- ◆ [Using the AAVerify Command](#)

10 Enabling Terminal Emulator Applications

This section provides information about enabling applications for single sign-on (SSO), enabling terminal emulator applications, and SSO support for MEDITECH applications.

In this Chapter

- ◆ [Enabling Terminal Emulator Applications](#)
- ◆ [Support for the MEDITECH Predefined Application](#)

For more information about enabling SSO for Windows, Web, and Java applications, see the [NetIQ SecureLogin 9.1 Application Definition Wizard Administration Guide](#).

10.1 Enabling Terminal Emulator Applications

You can configure terminal emulators for SSO in the application definition editor in the Administrative Management utility, in the SecureLogin Client Utility, and the Terminal Launcher tool.

To enable a terminal emulator for SSO, you must run the terminal launcher application (tlaunch.exe), and link the emulator definition to the terminal emulator application definition.

Terminal Launcher allows you to configure emulator definitions for use with SecureLogin.

- ◆ [Section 10.1.1, “Creating and Saving a Terminal Emulator Session File,” on page 81](#)
- ◆ [Section 10.1.2, “Building a Terminal Emulator Application Definition,” on page 82](#)
- ◆ [Section 10.1.3, “Running a Terminal Launcher,” on page 83](#)
- ◆ [Section 10.1.4, “Creating a Terminal Emulator Desktop Shortcut,” on page 84](#)
- ◆ [Section 10.1.5, “Setting Terminal Launcher Command Line Parameters,” on page 85](#)

NOTE: Contact NetIQ Support for information about using a ViewNow terminal emulator.

In the following sections, Eicon Aviva is used. Although these procedures apply to most terminal emulators, the application definition and other configuration information might differ for each emulator application. Contact Support for help.

10.1.1 Creating and Saving a Terminal Emulator Session File

Prior to enabling any terminal emulator for SSO, include or create a session file that provides all the required settings for the server connection and any other parameters required for deployment to users. Terminal Launcher should be configured to run this session file when launching the emulator.

Any modifications to the session must be saved to this file. The session file can be saved locally or on the server.

In most environments, the session file exists and you need to configure Terminal Launcher to point to the relevant file.

- 1 Start the terminal emulator application.
- 2 Connect to the required host.
- 3 Change the terminal emulator settings as required.
- 4 Save the session. The default directory is usually the application's installation directory.
- 5 On the **Connection** menu, click **Disconnect**. The session file remains loaded, but you are disconnected from the host.
- 6 On the **File** menu, click **Save** [session name] to save changes to the session file.
- 7 Exit the terminal emulator application.

10.1.2 Building a Terminal Emulator Application Definition

- 1 Open the SecureLogin Client Utility of SecureLogin by double-clicking, or by selecting **Start > Programs > NetIQ SecureLogin > NetIQ SecureLogin**.
- 2 Select **File > New > Application**. The New Application dialog box is displayed.
- 3 Select **New Application Definition**.
- 4 In the **Type** list, click **Terminal Emulator**.
- 5 In the **Name** field, specify a name for the application definition (in this example, Eicon Aviva), then click **OK**. The new application definition is added to the Applications pane.
- 6 Select the new application definition. The **Details** tab is displayed.
- 7 Click the **Definition** tab. The application definition editor is displayed.
- 8 Delete the default text: # place your application definition here
- 9 In this example for Attachmate, type the following in the text box:

```
WaitForText "WELCOME TO ATTACHMATE"  
Type @E  
WaitForText "ENTER USERID -"  
Type $Username  
Type @E  
WaitForText "Password ==>"  
Type $Password  
Type @E  
WaitForText " Welcome to Attachmate"  
WaitForText "****"  
Delay 1000  
Type @E
```

You must type the screen syntax accurately in the application definition editor. Else, it will fail to operate. Wherever possible, copy the text directly from the emulator screen to the editor.

- 10 Click the **Details** tab.
- 11 Ensure that the **Enabled** option is selected.
- 12 Click **OK**.

10.1.3 Running a Terminal Launcher

Terminal applications are invoked by the terminal launcher when configured properly. After you create the application definition in the management utility, you must use Terminal launcher to link it with the appropriate emulator definition.

By setting `tlaunch` to point to the new application and the emulator definition, you can click the Create Shortcut button to create a shortcut that links everything together. Clicking the shortcut `tlaunch` launches the emulator with the configured session file. When `tlaunch` can communicate with the emulator, it invokes the application definition to interact with the host session.

IMPORTANT: For successfully using Terminal Launcher on Windows XP SP3, the screen resolution must be 1024 by 768 pixels.

- 1 Select **Start > Programs > NetIQ SecureLogin > Terminal Launcher**. The Terminal Launcher dialog box is displayed.

This release of NetIQ SecureLogin provides two Terminal Launcher shortcuts: one each for 32-bit and 64-bit. To launch **Terminal Launcher 32** or **Terminal Launcher 64**, click **Start > All Programs > NetIQ SecureLogin > Terminal Launcher 32** or **Terminal Launcher 64**.

Use Terminal Emulator 32 to interact with 32-bit emulators. Use Terminal Emulator 64 to interact with 64-bit emulators.
- 2 In the **Available applications list**, click the required application definition (in this example, Eicon Aviva).
- 3 Click **Add** to move the selected application to the **Login to list**.
- 4 Click **Edit Available Emulators**. The Available Emulators dialog box is displayed.

If you launch Terminal Launcher as a normal user on Microsoft Windows Vista or higher, the Edit Available Emulator button is dimmed. You must have administrator rights to edit the `TLaunch.ini` file. To edit the `TLaunch.ini` file:

 - 4a Click **Start > All Programs > NetIQ SecureLogin**, select **Terminal Emulator 32** or **Terminal Launcher 64**.
 - 4b Right-click on **Terminal Launcher 32** or **Terminal Launcher 64**, then select **Run as administrator**.
- 5 In **Available Emulators**, click your emulator definition. In this example, `Eicon Aviva`.
- 6 Click **Edit**. The HLLAPI Emulator Configuration dialog box is displayed.
- 7 In the **Emulator Path** field, specify the emulator executable's location.
- 8 In the **Home Directory** field, specify the emulator's home directory.
- 9 In the **HLLAPI DLL** field, specify the file name and path.
- 10 In the **Session Files** field, select and delete the current session files.
- 11 Click **Add**. The Emulator Session File dialog box is displayed.
- 12 Browse and select the configured session file.
- 13 Click **OK** to close the Emulator Session File dialog box.
- 14 Click **OK** to close the HLLAPI Emulator Configuration dialog box.
- 15 Click **Done** to close the Available Emulators dialog box.

- 16 (Optional) Edit the `tlaunch.ini` or `tlaunch64.ini` file and add the following new parameters to launch the second Terminal Emulator without any delay:
 - ◆ `ConnectionRetryDelay`: Use this parameter to define the retry delay (in milliseconds). By default, the minimum value is 100 milliseconds.
 - ◆ `ConnectionRetries`: Use this parameter to define the number of retries. By default, the minimum number of retries is 20.
- 17 In the Terminal Launcher window, ensure that Eicon Aviva is selected in **Emulator**.
- 18 Save the changes and click **Launch**.

You can start emulator applications from within Terminal Launcher; however, users might not have access to Terminal Launcher or you might need to create multiple definitions for different hosts or sessions. To simplify this process for users, create a desktop shortcut by using **Create Shortcut**.

For SecureLogin to interact with the emulator, the emulator must be invoked by `tlaunch`. `tlaunch` launches the emulator and invokes the NSL script to interact with the terminal session. If a user were to launch the emulator directly then `tlaunch` would not be running and no interaction would occur.

10.1.4 Creating a Terminal Emulator Desktop Shortcut

- 1 Select **Start > Programs > NetIQ SecureLogin > Terminal Launcher**.
- 2 Click **Create Shortcut**.
- 3 Select **Location > Desktop**.
- 4 Select the appropriate options from **Options**. **Quiet mode** and **Suppress errors** are the default options.
- 5 In the **Command Line** field, ensure that the following parameters are included (in this example, `/auto /e"Attachmate" /pAttachmate /q /s`):

| Parameter | Description |
|--|--|
| <code>/auto</code> | Indicates to Terminal Launcher that the following is a parameter requesting the execution of a terminal emulator application that is configured for SSO. This parameter is mandatory. |
| <code>/e[application name]</code> | Initiates the execution of the terminal emulator. |
| <code>/p[Terminal Launcher config name]</code> | Initiates execution of the application created in Terminal Launcher. |
| <code>/q</code> | Quiet mode (no Cancel dialog box). |
| <code>/s</code> | Suppress errors. |

- 6 Add additional parameters as required. For more information, see [Section 10.1.5, "Setting Terminal Launcher Command Line Parameters,"](#) on page 85
- 7 Click **Create**. The shortcut is created on the desktop. You can deploy it to users in the preferred mode for your organization.
- 8 Click **Close** to close the Terminal Launcher dialog box.
- 9 Double-click the short cut.

10 In the **Enter login credentials** fields, specify your username and password.

11 Click **OK**.

SecureLogin stores the user's login credentials and uses them to log in to the host through the emulator session. Subsequently, double-clicking the desktop shortcut logs the user directly on to the host without any further user interaction.

10.1.5 Setting Terminal Launcher Command Line Parameters

To run the required terminal emulator, Terminal Launcher command line parameters are included in the desktop shortcut command. See [Creating a Terminal Emulator Desktop Shortcut](#).

Table 10-1 Terminal Launcher Command Line Parameters

| Parameter | Description |
|---|---|
| <code>/auto</code> | Indicates to Terminal Launcher that the following is a parameter requesting the execution of a terminal emulator application that is configured for SSO. For example: <code>C:\<...>\TLaunch.exe /auto /pApplication1</code> NOTE: This parameter is mandatory. |
| <code>/p[platform/application/Application Definition name]</code> | Initiates the execution of the terminal emulator as listed in Terminal Launcher Login to . To run multiple applications from the same command, add <code>/p[TL application/Application Definition name]</code> You can run up to 15 applications simultaneously from the shortcut command line. For example: <code>C:\<...>\TLaunch.exe /auto /eAttachmate /pApplication1 /pApplication2</code> NOTE: You must type the emulator name exactly as it appears in the Terminal Launcher Available Emulators drop-down list. |
| <code>/b</code> | Specifies the background authentication mode. |
| <code>/c</code> | Allows the application to close in case of any errors. For example: <code>C:\<...>\TLaunch.exe /auto /c /Application</code> Application refers to the terminal emulator application configured for SSO. |
| <code>/e[emulator name]</code> | The parameter <code>/e[Terminal Launcher config name]</code> initiates the execution of the terminal emulator as listed in Terminal Launcher Available Emulators . NOTE: You must type the emulator name exactly as it appears in the Terminal Launcher Available Emulators list. |
| <code>/h[hllapi short name]</code> | Commands <code>TLaunch.exe</code> to connect to the specified HLLAPI session. |
| <code>/k[executable name]</code> | Quits the specified executable prior to launching the terminal emulator. |

| Parameter | Description |
|---------------------------|--|
| /l | Disables the terminal emulator execution. This parameter is required when multiple instances of terminal emulator are running and you want to disable a few selected instances. |
| /m | Enables multiple concurrent connections to specified sessions. This parameter is required for background authentication. |
| /n | Starts the selected terminal emulator without executing a SecureLogin application definition. For example: C:\<...>\TLaunch.exe /auto /n NOTE: This parameter does not function with VBA emulators. It overrides /p option. |
| /n[number 1-15] | Starts the specified number of terminal emulator sessions without executing SecureLogin application definition. For example: C:\<...>\TLaunch.exe /auto /n3 NOTE: This parameter does not function with VBA emulators. It overrides /p option. |
| /q | Quiet Mode (no Cancel dialog bSox). For example: C:\<...>\TLaunch.exe /auto /q |
| /s | Suppress errors. |
| /t | Unlimited timeout during connection. For example: C:\<...>\TLaunch.exe /auto /eAttachmate /pBackground /b /t /m /hA /s /q |
| /w | Allows terminal emulator to wait for an application or process to complete before executing the next process. |
| /x [Shared Access Rights] | Setting EHLAPI shared access for read and write permission between multiple EHLAPI sessions. For example: C:\<...>\TLaunch.exe /auto /eAttachmate /pBackground /b /t /m /hA/s /q /xSUPER_WRITE |

| Parameter | Description |
|-----------|---|
| /hwnd | <p>Use this parameter to pass an application handle to the terminal launcher. This parameter indicates the application window the terminal launcher should interact with.</p> <p>For example: This is an application definition script that uses <code>GetHandle</code> command to get the handle and passes it to <code>TLaunch.exe</code> using the <code>/hwnd</code> parameter.</p> <pre> GetReg "HKLM\Software\Microsoft\Windows\CurrentVersion\App Paths\SLProto.exe\Path" ?SLLocation If ?SLLocation eq "<NOTSET>" EndScript EndIf GetHandle ?PuttyHWND Strcat ?TLaunch ?SLLocation "tlaunch.exe" Strcat ?TLaunchHWND "/hwnd" ?PuttyHWND Run ?TLaunch "/auto" "/ePutty" "/l" "/pPutty - Detection and Login" "/t" "/q" "/s" ?TLaunchHWND </pre> |

Table 10-2 List of session options for EHELLAPI shared access support

| Parameter | Description |
|---------------|---|
| /xWRITE_WRITE | <p>By default the application has write access and allows only supervisory application to concurrently connect to its presentation space (<code>WRITE_SUPER</code>).</p> <p>Using <code>WRITE_WRITE</code> parameter allows other applications with predictable behavior to share the presentation space.</p> <p>For example: <code>C:\<...>\auto /e"Attachmate" /Tlaunch_script /q /s /xWRITE_WRITE</code></p> |
| /xSUPER_WRITE | Allows other applications to have write access permissions, while the originating application may only perform supervisory functions. |
| /xWRITE_SUPER | Allows other applications to perform supervisory functions, while the originating application has complete control of the session. |
| /xWRITE_READ | Allows other applications that perform read-only functions to share their session, while the originating application has complete control of the session. |
| /xWRITE_NONE | Does not allow any other applications to share the presentation space. |
| /xREAD_WRITE | Allows other applications to write to the session, while the originating application has read-only access. |

10.2 Support for the MEDITECH Predefined Application

SecureLogin supports MEDITECH 3.x and 4.x. It is dependant on the mandatory presence of the MEDITECH `mrwscript.dll`. The `.dll` file is provided by MEDITECH and must be installed during the installation of the MEDITECH application on the workstation.

NOTE: If you are an existing customer of Meditech, you can obtain the `mrwscript.dll` as part of your MEDITECH support agreement.

During the installation of the predefined MEDITECH application, SecureLogin detects the presence of the application and immediately warns, if the file cannot be located.

11 Reauthenticating Applications

When a user runs an application, SecureLogin seamlessly retrieves the user's application credentials and authenticates in the background so that the user is not prompted to specify the password. You can also configure SecureLogin to prompt the user for stronger authentication to all or specific applications.

Individual applications can be re-authenticated against any advanced device where SecureLogin is used. For example, NMAS™ infrastructure.

You can configure SecureLogin to request application reauthentication by using one of the following methods:

- ♦ [Using the Administrative Management Utility](#)
- ♦ [Using the Application Definition Wizard](#)
- ♦ [Using the AAVerify Command](#)
- ♦ [Using the Risk Policy of Advanced Authentication](#)

NOTE: For environments that use NMAS, you can add the NMAS method in the **Reauthentication Method** (in the wizard login form definition screen) value by providing a free text string.

11.1 Using the Administrative Management Utility

- 1 Launch SLManager.
- 2 Click **Applications**.
- 3 Double-click the application that you want to use for reauthentication.
- 4 Click the **Settings** tab.
- 5 Set the value for **Prompt for device reauthentication for this application** to **Yes**.
- 6 In **Reauthentication Method**, select the device that you will use for reauthentication.
Click **Any** if you want the user to choose from any of the available methods.

11.2 Using the Application Definition Wizard

When creating an application definition to handle an application login screen through the application definition wizard, you can configure the definition to reauthenticate a user.

For information, see the [NetIQ SecureLogin 9.1 Application Definition Wizard Administration Guide](#).

11.3 Using the AAVerify Command

For applications that cannot enforce user authentication natively, use the AAVerify command to enforce stronger application-based reauthentication, such as biometric, token, or smartcard authentication.

It is recommended to place the AAVerify command in the application script prior to the normal login section. This way the AAVerify command requests the pre-configured strong reauthentication method before SecureLogin retrieves and enters the username and password for the application.

For more information about the AAVerify command, see “AAVerify” in the [NetIQ SecureLogin 9.1 Application Definition Guide](#).

11.4 Using the Risk Policy of Advanced Authentication

If SecureLogin is installed with Advanced Authentication, you can use the risk policy configured in Advanced Authentication to login using SecureLogin kiosk and re-authenticate users when they access applications containing sensitive data. The risk policy evaluates the risk level during each access attempts using contextual information. For example, contextual information can be IP address and device information.

You can define an appropriate action for each risk level in the policy, such as granting access or asking for additional authentication. In case of high risk, you can configure to deny access.

For more information about how to configure a risk policy in Advanced Authentication, see [Configuring Risk Settings](#) in the [Advanced Authentication - Administration](#) guide.

Configuring context-aware multi-factor reauthentication for an application involves the following steps:

1. [In Advanced Authentication](#): Perform the following actions:
 - a. Configure a risk policy with required rules.
 - b. Configure chains for each risk level.
 - c. Configure or modify the event for SecureLogin, and map the risk policy and chains to the event. This event must be the same one that is selected while enabling Advanced Authentication for SecureLogin. By default, the Windows Logon event is used.
2. [In SecureLogin](#): Configure to use the default method for reauthentication in the Application Definition Wizard for the identified application.

Example

Let's use the following example to understand the configuration:

Your organization provides a Human Resources portal to all employees. Inside the corporate network and within business hours, all employees can access the Human Resources (HR) portal using only SSO.

However, you want the employees to reauthenticate when it is accessed beyond business hours and from an external network.

To achieve this scenario, perform the following steps:

In Advanced Authentication:

1 Configure a risk policy with IP Address Rule and User Time of Login Rule.

1a Click **Risk Settings > Create a Risk Policy** icon.

1b Specify the following details:

- ◆ **Policy Name:** Specify the name as `SecureLoginPolicy`.
- ◆ **Description:** Specify the purpose of this policy.

1c Configure **IP Address Rule** and **User Time of Login Rule** in the same sequence as follows. The rules are executed in the top to bottom sequence.

| Rule | Configuration Steps |
|-------------------------|---|
| IP Address Rule | <ol style="list-style-type: none">1. Click Add Rule.2. Specify the rule name and the description.3. Select IP Address Rule from Choose a Rule Type.4. Select Is from Allow if IP address in the list.5. Select IP address range in Manually enter the Data source.6. Specify the range of the IP address. For example, 10.0.0.0 to 10.255.255.2557. Click Save. |
| User Time of Login Rule | <ol style="list-style-type: none">1. Click Add Rule.2. Specify the rule name and the description.3. Select User Time of Login Rule from Choose a Rule Type.4. Select Is from User time of login.5. Select the date range from Monday to Friday.6. Select the time range from 9:00 AM to 6:00 PM.7. Click Save. |

1d Set up the risk levels:

- ◆ Move the blue slider to 1 to indicate that if one rule fails, the risk is medium.
- ◆ Move the green slider to 0 to indicate when no rules fail, the risk is low.
- ◆ If both rules fail, then the risk is high.

1e Click **Save**.

2 Configure chains.

2a Create the following chains:

| Chain | Steps |
|---------------------------|--|
| For the low-risk level | <ol style="list-style-type: none">1. Click Chains > Add.2. Specify a name for the chain in Name. For example, <code>LowRisk</code>.3. Specify a Short name.4. Set Is enabled to ON to enable the chain.5. Select Methods you want to add to the chain. For example, <code>Password</code>.6. Specify the groups that will use the authentication chain in Roles and Groups.7. Expand Risk Settings by clicking +.8. In Minimum Risk Level, select Low.9. Click Save. |
| For the medium risk level | <ol style="list-style-type: none">1. Click Chains > Add.2. Specify a name for the chain in Name. For example, <code>MediumRisk</code>.3. Specify a Short name.4. Set Is enabled to ON to enable the chain.5. Select Methods you want to add to the chain. For example, <code>Password</code> and <code>SMS OTP</code>.6. Specify the groups that will use the authentication chain in Roles and Groups.7. Expand Risk Settings by clicking +.8. In Minimum Risk Level, select Medium.9. Click Save. |

For more information about chains, see [Creating a Chain](#) in the [Advanced Authentication Administration Guide](#).

2b Click **Save**.

3 Modify the Windows logon event.

3a Click **Events > Windows logon**.

3b Select `MediumRisk` and `LowRisk` chains that you created in [Step 2 on page 92](#).

3c In **Risk Policy**, select `SecureLoginPolicy`.

3d Click **Save**.

For more information about events, see [Configuring Events](#) in the [Advanced Authentication Administration Guide](#).

In **SecureLogin**:

1 Right-click the **SecureLogin** icon in the notification area, and then click **Manage Logins**.

2 In **Applications**, select the application for which you want to enable reauthentication.

3 Select the **Definition** tab.

- 4 Click **Edit Wizard > Re-authenticate**.
- 5 Click **Yes. Enforce re-authentication before accessing this application**.
- 6 In **Select from the methods detected**, select `<Default>`.
- 7 Click **OK**.

12 Managing Application Definitions

- ♦ [Section 12.1, “Responding to Application Messages,” on page 95](#)
- ♦ [Section 12.2, “Responding to Login Notifications,” on page 95](#)
- ♦ [Section 12.3, “Adding Support for Password Changes,” on page 95](#)
- ♦ [Section 12.4, “Responding to Change Password Notification,” on page 96](#)

12.1 Responding to Application Messages

When building an application definition for an application using the wizard, it is very important to respond appropriately to any message that the wizard displays. You must include actions for each of these messages in the application definition for SecureLogin to function correctly.

12.2 Responding to Login Notifications

A login notification is a message that the application displays after a user login has submitted. This message is meant to notify you of the status of the login request. For example, the login notification might indicate that you have successfully logged in or that you have specified a wrong password.

You can define how SecureLogin must handle login notifications in your application definition.

12.3 Adding Support for Password Changes

Depending on your organization's policies regarding password expiration, users might be required to change their passwords on a regular basis. Each time a user's password is changed for an application that is enabled for single sign-on, SecureLogin must update the stored credential information so that the next time the application is launched SecureLogin can provide the new password information.

To ensure that user password changes are updated in SecureLogin, configure SecureLogin to respond to the Change Password dialog box.

You can configure SecureLogin to automatically generate a new password (according to password policy, if required) whenever the Change Password dialog box is displayed. A randomly generated password is safer than a user-defined, reusable password.

12.4 Responding to Change Password Notification

A change password notification is a message that the application displays after a user has submitted a new password.

This might be a confirmation or error message. This notification is important to SecureLogin because it provides the information necessary for SecureLogin to determine if it needs to update the stored credentials of the application.

If a password change notification is not defined, SecureLogin prompts the user to define the notification, after changing the password.

13 Distributing Configurations

- [Section 13.1, “About Distributing Configurations,” on page 97](#)
- [Section 13.2, “Distributing Configurations Within Directory Domains,” on page 98](#)
- [Section 13.3, “Setting Corporate Redirection,” on page 98](#)
- [Section 13.4, “Configuring Groups Within eDirectory,” on page 100](#)
- [Section 13.5, “Copying a Configuration Across Organizational Units,” on page 100](#)
- [Section 13.6, “Creating an Active Directory Group Policy,” on page 101](#)

13.1 About Distributing Configurations

SecureLogin preferences, application definitions, password rules, and credentials are collectively the SecureLogin configured user environment. You can deploy and maintain this environment at all object levels, including import/export by file, copy to another object, and so forth. The SecureLogin data can be added to users, containers, groups and even through Group Policy Objects in Active Directory environments.

A single sign-on environment that is configured at the container, organizational unit, or Group Policy level is inherited by all associated directory objects in the hierarchy.

First, enable applications for single sign-on with one user, then copy the applications to the container, OU or Group Policy level for mass deployment. This applies to all SecureLogin configurations, including password policies and preferences. Lower-level settings that you manually configure always override higher-level settings. Therefore, configuration at the user object level overrides all higher level configuration settings. You can manually disable inheritance from objects higher in directory by selecting Yes next to Stop walking here in the Preferences of the desired object. For example you can set this value at the partition boundaries to keep users from needing to walking across WAN links to locate inherited values for SecureLogin.

The inherited settings include configuration properties, application definitions, password policies, and credentials. For example, if a user belongs to the following hierarchy of containers and groups:

```
Container 1: SettingsOfContainer1
    Container 2: SettingsOfContainer2
        Group 1 applies to Container 2: SettingsOfGroup1
            User: settings, credentials
```

Then, the user will inherit SettingsOfContainer1, SettingsOfContainer2, SettingsOfGroup1, settings, and credentials. However, the preference values set at the user object level override any values inherited from other objects in the directory. The settings configured at the lower level in the hierarchy take precedence over the settings at the higher level. For example, settings in container 2 would take precedence over settings in container 1.

13.2 Distributing Configurations Within Directory Domains

There are two options for distributing the single sign-on-configured environment:

- ♦ **Corporate Redirection:** Specifies the object from which the selected object will inherit its SecureLogin configuration settings.
- ♦ **Copy SecureLogin Configuration:** Replicates and stores the SecureLogin environment from one directory object to another.

Table 13-1 SecureLogin Configuration Options

| If | Then |
|--|---|
| <ul style="list-style-type: none">♦ Multiple containers or organizational units require the same SecureLogin environment, and you want to manage configuration from one directory object.♦ Inheritance, from a higher level object in the directory is not required.♦ The container or OUs are on the same directory tree. <p>Do not use Corporate redirection across a slower WAN link.</p> | Click Corporate redirection . |
| <ul style="list-style-type: none">♦ You want to distribute configurations within the same directory across a slower WAN link.♦ You want to replicate a complete SecureLogin configuration environment from one object to another in the directory.♦ You do not want to use XML files to distribute SecureLogin configuration data. | Click Copy SecureLogin configuration . |

13.3 Setting Corporate Redirection

The Corporate Redirection policy distributes SecureLogin settings of a specified object, which can be a container or an organizational unit, to another directory. When this policy is enabled, the recipient directory ignores the SecureLogin settings of its parent directory and inherits the SecureLogin settings of the specified object. The inherited SecureLogin configurations can include enabled applications, password rules, or any other settings.

The Corporate Redirection functionality bypasses the Microsoft Active Directory, NetIQ eDirectory™ inheritance by specifying the source object from which the current object inherits its single sign-on configuration. Although inheritance is redirected to a specific object, such as a container or organizational unit, local user object settings continue to override the inherited settings.

Before you set corporate redirection, the Administrative Management utility must be active.

Corporate redirection cannot be applied to a group object because they are not part of the hierarchy but linked to it.

Consider the following example:

- 1 Create two directory containers (OU's) under O=novell:
 - ♦ ou_apps
 - ♦ ou_users

- 2 Create a user (`user1`) in `ou_users` (`user1.ou_user.novell`).
- 3 Create SecureLogin applications and, or define settings on the `ou_apps.novell` container.
- 4 Set corporate redirection on `ou_users.novell` to point to `ou_apps.novell`. The following is seen:
 - ◆ `user1` has applications and settings defined at `ou_apps.novell`.
 - ◆ `user1` also has its own applications and settings.

You can configure the **Corporate redirection** preference only to be redirected to a specific organizational unit or container.

- ◆ When set to a user, the user does not inherit any SecureLogin preferences from their nominal hierarchy but from the other organizational unit or container.
- ◆ When applied to an organizational unit or container, any user in that object does not inherit SecureLogin preferences from its container settings. It inherits from the other organizational unit or container.

To get the correct inheritance, users must be granted the correct rights to inherit from other object. The inheritance process stops at the redirected container. There is no inheritance from the redirected object's hierarchy.

In the following example, the Finance organizational unit is redirected to inherit the SecureLogin configuration from the Development organizational unit.

- 1 Launch the Administrative Management utility (SLManager or MMC snap-ins).
- 2 Click **Advanced Settings**.
- 3 Specify the full distinguished name of the object in **Corporate redirection**.

NOTE: The full distinguished name is required to uniquely identify the container or organizational unit.

In this example, the Development organizational unit (`ou=development,dc=training7,dc=com`)

- 4 Click **Apply**.
- 5 Click **OK**.

Click **Applications** to view the application definitions inherited from the object. Click **Preferences** to view the inherited preferences. In this example, the preferences inherited from the Development ou.

Ensure that you do not overwrite administrator settings when distributing SecureLogin configuration environments. For example, if you set the preference **Allow users to view and change settings** to **No** and then copy this to the container or organizational unit as part of a SecureLogin environment, including the Administrator user object, the administrator cannot view or change SecureLogin settings because they reside in that organizational unit. To prevent this from happening, all administrator user objects should be located in a separate organizational unit, and administrator preferences should be manually configured.

13.4 Configuring Groups Within eDirectory

You must make additional attribute assignments to the group objects. This is primarily required when users use different administrative management utilities, such as NWAdmin or ConsoleOne.

- 1 Launch SLManager.
- 2 Specify the distinguished name of the container object you want to modify.

NOTE: SecureLogin supports configuring group memberships only within a container object.

- 3 Select **Advanced Settings > Configured Groups**. The Group Configuration dialog box is displayed.
- 4 Click **Add**.
- 5 Provide the distinguished name of the group object.
- 6 Click **OK** to add the new group object.

Use the **Up** and **Down** options to promote or demote the order in which the group policies are applied.

NOTE: Within the Group Configuration, the higher group takes precedence.

Configured groups can only be set against containers like O and OU and not set against a user object. In such a case, contrary to the earlier statement, the higher container takes the lower precedence.

When looking at the defined SecureLogin applications from within the properties of a group member, you will not see the "innerweb" application listed. However, the configured application will be available in the client when SecureLogin is launched at the workstation.

13.5 Copying a Configuration Across Organizational Units

You can copy an object's SecureLogin configuration to another object from the **Distribution** pane in the Administrative Management utility. This functionality replicates the SecureLogin configuration internally in the same directory tree.

NOTE: In the following example, the Development organizational unit SecureLogin environment is copied to the Finance organizational unit.

- 1 Launch the Administrative Management utility (SLManager or MMC).
- 2 Click **Distribution > Copy**.
- 3 Under **Select SecureLogin Configuration**, select or clear the appropriate check boxes.

| Configuration | Function |
|---------------|--|
| Applications | Copies, exports, or imports all configured application definitions, as displayed in the Applications pane. |
| Credentials | Copies, exports, or imports all credentials as displayed in the Logins pane, excluding passwords. |

| Configuration | Function |
|----------------------------|--|
| Password Policies | Copies, exports, or imports password policies as displayed in the Password Policies Properties table |
| Preferences | Copies, exports, or imports all preferences manually set in the Preferences pane. |
| Active Passphrase Question | Provides users with a selection of passphrase questions. This option copies, exports, or imports only the passphrase question the user has responded to. |

4 In the **Destination Object**, click the name of the object or type the full distinguished name.

5 Click **Copy**.

If a predefined application or an application definition currently exists in the destination object, a confirmation message appears. It confirms or rejects the overwriting of the imported data.

6 Click **Yes** or **No** as required.

The selected SecureLogin configuration is copied across to the destination user object, organizational unit or container. A confirmation message appears, advising what information has been loaded to the destination object.

7 Click **OK**.

13.6 Creating an Active Directory Group Policy

- ♦ [Section 13.6.1, “Group Policy Object Support,” on page 101](#)
- ♦ [Section 13.6.2, “Group Policy Management Console Support,” on page 102](#)
- ♦ [Section 13.6.3, “Definition of a Group Policy Object,” on page 102](#)
- ♦ [Section 13.6.4, “Adding or Editing a Group Policy Object,” on page 103](#)
- ♦ [Section 13.6.5, “Installing the GPMC Plug-In,” on page 103](#)
- ♦ [Section 13.6.6, “Retrieving a Policy Applied to the User Object in GPMC,” on page 104](#)
- ♦ [Section 13.6.7, “Retrieving a Policy Applied to the User Object in SLManager,” on page 105](#)

13.6.1 Group Policy Object Support

Prerequisites:

- ♦ SecureLogin is installed with support for group policies.
- ♦ The Active Directory Users and Computers snap-in or Group Policy Management Console is open.

Using Group Policy object support, you can manage SecureLogin users in Active Directory users at the container, OU, and user object levels.

Group Policy object support is useful for organizations with flat directory structures where a more granular approach is required when applying settings, policies, and application definitions for users. For example, applying a group policy for a global marketing group in a worldwide organization. Several group policies can be defined and applied to any user, group, or container at the directory level. These different policies are then applied to a specific user object or container or organizational unit through the inheritance process.

To limit network traffic during the Group Policy object synchronization, SecureLogin leverages an existing Microsoft Windows feature to specify policy settings that are updated when the group policy object changes.

Edit the WinLogon/GPextensions in the Windows Registry, and set the NoGPListChanges key to 1.

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows  
NT\CurrentVersion\Winlogon\GPExtensions\{2893059c-1175-11d9-8088-  
00e018f97d4d
```

13.6.2 Group Policy Management Console Support

You can see the resultant set of single sign-on policy settings that apply to a particular user object when multiple SecureLogin group policies and organizational unit or user object setting are applied through the Microsoft's Group Policy Management Console (GPMC), which now includes support for Resultant Set of Policy (RSOP).

NOTE: The GPMC must be installed on the administrative workstation where you want to see the resultant set of policies.

Resultant Set of Policy Settings

The Resultant Set of Policy (RSOP) is a feature of a group policy that makes the implementation, troubleshooting, and planning of group policies easier and allows you to plan how the group policy changes might affect a targeted user or computer or remotely verify the policies under effect on a specific computer.

When multiple group policy objects are applied to a given user or computer, the policy can often contain conflicting policy settings. For most policy settings, the final value of the setting is set only by the highest precedent Group Policy object that contains that setting.

RSOP assists directory administrators to understand and identify the final set of policies that are applied as well as settings that did not apply as a result of policy inheritance.

In this version of SecureLogin, you can see the final SecureLogin settings that apply to a user when he or she starts SecureLogin. You have the ability to do the following:

- ◆ Retrieve the policy applied to the user object in the Microsoft Management Console.
- ◆ Retrieve the policy applied to the user object in SLManager.
- ◆ Define from which policy the setting is inherited.

13.6.3 Definition of a Group Policy Object

IMPORTANT: Group policy functionality is enabled only if it was selected during the installation of SecureLogin in Microsoft Active Directory mode. For more information, see the [“Installing and Configuring in an Active Directory Environment”](#).

For more information about Group Policy Objects (GPOs), go to the [Microsoft website](#).

Policy settings are stored in Group Policy Objects (GPOs). Settings for each GPO can be edited using the GPO Editor from within Microsoft's Group Policy Management Console (GPMC).

When an administrator defines a SecureLogin GPO, they can now use the GPMC to add this group policy or edit and configure the SecureLogin settings.

13.6.4 Adding or Editing a Group Policy Object

Policy settings are stored in Group Policy object settings for each Group Policy object and can be edited using the Group Policy object editor from Microsoft (GPMC).

The group policy functionality is enabled during the installation of SecureLogin in Microsoft Active Directory mode. For more information, see “[Installing and Configuring in an Active Directory Environment](#)” in the *SecureLogin 9.1 Installation Guide*.

When you define a SecureLogin Group Policy Object, administrative users can use the GPMC tool to add this group policy or edit and configure the SecureLogin settings.

13.6.5 Installing the GPMC Plug-In

With the Microsoft's GPMC plug-in, you can manage core aspects of Group Policy object across enterprises.

For Microsoft Vista (or higher) customers, the GPMC snap-in is already integrated in to the operating system.

Existing Windows XP and Server customers can download the `gpmc.msi` installer package at the [Microsoft website](#) and install the Microsoft GPMC plug-in.

NOTE: After installation, the **Group Policy** tab that previously was on the Property pages of sites, domains, and organizational units in the Active Directory plug-in is updated to provide a direct link to GPMC. The functionality that previously existed on the **Group Policy** tab is no longer available because all functionalities for managing a Group Policy is available through the GPMC plug-in.

Managing Group Policy Objects through the GPMC

Use any of the following methods to open the GPMC plug-in directly:

- ◆ Click **Start > Programs > Administrative Tools > Active Directory Users and Computers**. The Active Directory Users and Computers page is displayed.
 - ◆ In the navigation tree, right-click the appropriate organizational unit, then click **Properties**. The selected organizational unit page is displayed.
 - ◆ Click **Group Policy**, then click **Open**.
 - ◆ Click **Start > Programs > Administrative Tools > Group Policy Management**.
 - ◆ Click **Start > Run**. The Run page is displayed.
- 1 At **Open**, type `mmc`.
 - 2 Click **OK**. The Management Console is displayed.
 - 3 Click **File**.

- 4 Click **Add/Remove Snap-in**. The **Add/Remove** page is displayed.
- 5 Click **Add**. The Add Standalone Snap-in page is displayed.
- 6 Select **Group Policy Management** and then, click **Add**.
- 7 Click **Close**. The Add Standalone Snap-in page is displayed.
- 8 Click **OK**. The Group Policy Management page is displayed.

NOTE: When you launch the GPMC for the first time, it loads the forest and domain containing the user object logged in to the computer. You can then specify the forest and domain to be displayed.

When you close the GPMC, it automatically saves the last view and returns that view the next a user opens the console.

13.6.6 Retrieving a Policy Applied to the User Object in GPMC

The definition of the Group Policy Objects are defined by the administrator at the directory level, so changes can now be seen immediately at the OU, container or user object level, depending on the level where the group policies have been applied and the SecureLogin preferences applied.

These settings must follow the rules already defined of inheritance and precedence:

- ◆ The **Stop walking here** preference
- ◆ The **Corporate Redirection** setting
- ◆ The Group Policy object settings and their priorities
- ◆ The directory hierarchy settings

The precedence rules are respected and follow the rules already defined:

- ◆ The deepest object in the tree has the precedence over any other higher-level object
- ◆ The group policies have the lower precedence than all OUs and User objects.

As a consequence of all these processes, the administrator can now see the resultant set of the policies in the user object either through MMC interface or administrative management utilities.

The resultant set of policies are displayed in the bottom left hand corner of the SecureLogin Administration Management utility. They show from which Group Policy the current setting has been inherited.

NOTE: The retrieval of all SecureLogin configuration information is subject to both SecureLogin and native Directory access controls. In the unlikely circumstance that the user has rights to read a Group Policy object but the administrator does not, this system displays incorrect effective configuration information. This is because the administrator simply cannot access the same information as the user, and any mechanism for allowing this would introduce a security problem.

In this specific configuration, if SecureLogin has no way to retrieve the exact policy applied to the user object, then a message is displayed indicating that the information displayed does not correspond to the resultant set of policies applied to this user object. The message **RSOP not available** is displayed in the bottom left side of the Administration Management console.

13.6.7 Retrieving a Policy Applied to the User Object in SLManager

Because the definition of the Group Policy objects are performed by you at the directory level, any changes are now seen immediately at the OU, container, or the user object level.

14 Managing Configurations

You can use SecureLogin to export or import unencrypted and encrypted XML files. The export functionality of SecureLogin creates an XML file that is external to the directory. You can import the SecureLogin information from this XML file to different directory types, servers, domains, containers, group policies, organizational objects, and user objects.

- ♦ [Section 14.1, “Exporting the Single Sign On Data in Encrypted XML Files,” on page 107](#)
- ♦ [Section 14.2, “Importing Single Sign-On Data in Encrypted XML Files,” on page 108](#)
- ♦ [Section 14.3, “Creating a Signing Key for Secure Distribution,” on page 108](#)
- ♦ [Section 14.4, “Locally Installing a Digital Signing Key,” on page 110](#)

14.1 Exporting the Single Sign On Data in Encrypted XML Files

Using SecureLogin Manager (SLManager), you can encrypt and password-protect or digitally sign the exported files to ensure the information is secure. Alternatively, you can also export an unencrypted file for unrestricted distribution.

- 1 Launch SLManager.
- 2 In the object field, specify your object name, then click **OK**.
- 3 Click **Distribution**.
- 4 Click **Save**.
- 5 Select the configurations that you want to export.

| Configuration | Function |
|----------------------------|--|
| Application | Exports all configured application definitions as displayed in Application . |
| Credentials | Exports all credentials as displayed in the Logins pane, including passwords. |
| Password Policies | Exports password policies as displayed in the Password Policies Properties table. |
| Preferences | Exports preferences manually set in the Preferences Properties tables. |
| Passphrase Question | Provides users with a selection of passphrase questions. This option copies, exports, and imports only those passphrase questions to which the user has responded. |

- 6 In **Select File Protection**, select **Password protected and encrypted**. If you select **Not encrypted**, credentials will not be exported.
- 7 Specify and confirm the password.
- 8 Click **OK**.
- 9 Select the applications to be exported and click **OK**.

- 10 Specify a name for the file, select a location, and click **Save**.
- 11 Click **OK**.

14.2 Importing Single Sign-On Data in Encrypted XML Files

- 1 Launch SLManager.
- 2 In the object field, specify your object name, then click **OK**.
- 3 Click **Distribution**.
- 4 Click **Load**.
- 5 Select the configurations you want to import.

| Configuration | Function |
|----------------------------|--|
| Application | Imports all configured application definitions as displayed in Application . |
| Credentials | Imports all credentials as displayed in the Logins pane, including passwords. |
| Password Policies | Imports password policies as displayed in Password Policies Properties . |
| Preferences | Imports preferences manually set in the Preferences Properties tables. |
| Passphrase Question | Provides users with a selection of passphrase questions. This option copies, exports, and imports only those passphrase questions to which the user has responded. |

- 6 Click **OK**.
- 7 Select the exported encrypted (ESX) file.
- 8 Click **Open**.
- 9 Specify the password and click **OK**.
If a predefined application or an application definition already exists in the destination object, you get a confirmation message.
Click **Yes** if you want to overwrite the existing application definition with the imported one.
- 10 If you click **Yes**, the configuration is copied across to the user object, organizational unit, or container. A confirmation message appears indicating that the information is copied to the destination object.
- 11 Click **OK**.

14.3 Creating a Signing Key for Secure Distribution

After you configure and tested SecureLogin in an user environment, you can create a digital signing key that is embedded in the .exe file. You can distribute the file through a web download or email to the users. When users receive the file, they need to double-click the file to load to the local workstation. This updates the following configurations:

- ♦ Preferences
- ♦ Application definitions

- ◆ Password rules
- ◆ Credentials

This is collectively known as the SecureLogin configured user environment. This is designed for users of standalone SecureLogin (such as mobile users) and those who do not frequently connect to the corporate network.

When a digital signing key is created, the key pair is randomly generated by SecureLogin to increase security.

To create a digital signing key, perform the following steps:

- 1 Launch SLManager.
- 2 In the object field, specify your object name, then click **OK**.
- 3 Click **Distribution**.
- 4 Click **Save**.
- 5 Select the configurations you want to export.
- 6 Under **Select File Protection**, select **Digitally signed and encrypted**.
- 7 (Optional) Select **Administrative data will overwrite user's data without notification**.

If you select this option, users are prompted before overwriting any data with the configuration settings saved in the .msi file.

IMPORTANT: Selecting this option results in the user data being overwritten with the configuration setting in the .msi file for any items that are present in both user's local configuration and administrative configuration (.exe file).

For example, if a user has an application definition configured locally, and a predefined application definition is supplied in the .exe file, the .exe file application definition overwrites the user's application definition without notification.

However, for example, if a user has configured a Hotmail application definition locally, and a predefined application is not supplied in the .msi file, the user's Hotmail application definition is not changed.

- 8 Click **Manage Keys**.
- 9 Specify a name for the key in **Generate Digital Signing Key**.
- 10 Click **Create > Close**.
- 11 In **Key List**, select the newly created key.
- 12 Under **Install**, click **Install Package**.
- 13 Browse to locate the distribution file (.msi file) in which you want to embed the key.
- 14 Click **Open**. A confirmation message that the key is embedded in the .msi file is displayed.
- 15 Click **OK**.

You can now distribute and install the .msi file on the user's machine. This allows them to import signs that are signed and encrypted.

After the keys are created, they must not be deleted because they are randomly generated. The key used must correspond to the key that is been previously packaged and with the distributed installer.

14.4 Locally Installing a Digital Signing Key

- 1 Log in to SLManager.
- 2 In the object field, specify your object name, then click **OK**.
- 3 Click **Distribution**.
- 4 Click **Manage Keys**.
- 5 Specify a name in **Generate Digital Signing Key**.
- 6 Click **Create**.
- 7 In the list, select the new key.
- 8 Under **Install**, click **Install Locally**.
- 9 Click **OK**.

15 Using the sIAP Tool

- ◆ [Section 15.1, “About the sIAP Tool,” on page 111](#)
- ◆ [Section 15.2, “The sIAP Syntax,” on page 112](#)

15.1 About the sIAP Tool

The SecureLogin Attribute Provisioning (sIAP) tool uses command line options to allow SecureLogin to leverage user data from an organization’s provisioning system. Using the sIAP tool, you can import data, in XML format from third-party applications into the SecureLogin user’s datastore and export information (except passphrase answers).

This tool can import and export the following data:

- ◆ User variables
- ◆ Application definitions
- ◆ Organizational settings
- ◆ Password
- ◆ Password policies
- ◆ Logins
- ◆ Passphrase questions

The sIAP tool command operates as a provisioning tool between SecureLogin data in a directory and in an XML file. The XML schema used is the same as the Copy Settings GUI importer/exporter. In addition to copying settings, the sIAP tool can extract user names.

For example, an organization with 10,000 users in a SAP system, implementing SecureLogin can speed deployment significantly by automating the initial user login. To do this, use a file containing multiple users’ username and password combinations from SAP, and use the sIAP tool to import the file into the SecureLogin datastore as a bulk process. The sIAP tool removes the requirement for each user to enter credentials on the first log in to SecureLogin.

If the sIAP tool is used to import data into SecureLogin from an encrypted or an unencrypted file, and any preferences are set that require the SecureLogin version 6 data store format, then the datastore version must be specified in the file. Preferences that require the version 6 format are:

- ◆ EncryptionType
- ◆ NRKeySource
- ◆ StoreDataOnSmartCard
- ◆ UseEnhancedProtectionByDefault

The datastore version is set as:

```
<preference>
  <name>AppliedSSODataStoreVersion</name>
  <value>600000</value>
  <isdatastore/>
</preference>
```

If the value of this preference is not set to 6, 6.0, or 600000 then an error message is returned from the slAP tool: *Cannot import version 6 datastore preferences into a lower versioned datastore.*

When the slAP tool is used for initial provisioning of SecureLogin user accounts, before any SecureLogin data has been stored for users, the XML file must include a passphrase question and response. This question/response can be the same for each user and can be changed by the user after deployment.

NOTE: SecureLogin does not need to be running to use the slAP tool.

15.2 The slAP Syntax

```
slaptool [-hlvasISpEcPefdF] [-k password] -r object_name_file | -o "object" [file | App ID | Credential ID]
```

The following table describes the command options:

| Command | Description |
|-------------|---|
| -h | Displays a help message and exits (all other options are ignored). |
| -l | Excludes user IDs. |
| -v | Excludes variables. |
| -a | Excludes applications. |
| -s | Excludes settings. |
| -S | Include passwords. Only applies to export operations which include symbols and must be used in conjunction with <code>-E</code> for security. |
| -p | Excludes password policies. |
| -E password | Specifies that the generated XML should be encrypted or decrypted using the supplied password. Password must be at least 8 characters long. |
| -f | Use the current user, for export allow inclusion of password credentials. (Cannot be used with <code>-r</code> or <code>-o</code>). |
| -c | Excludes credsets. |

| Command | Description |
|------------------------------|--|
| -d | <p>Performs delete rather than import.</p> <p>For example:</p> <ul style="list-style-type: none"> ◆ To delete logins: <code>slaptool -d -o "cn=abc,dc=123" -l</code> ◆ To delete applications: <code>slaptool -d -o "cn=abc,dc=123" -a</code> ◆ To delete password policy: <code>slaptool -d -o "cn=abc,dc=123" -p</code> <p>NOTE: You can also use <code>-f</code>, to perform delete operation for the current user.</p> <p>For example:</p> <ul style="list-style-type: none"> ◆ <code>slaptool -d -f -l</code> |
| -F | <p>Performs delete of all applications or login without user confirmation.</p> <p>For example:</p> <ul style="list-style-type: none"> ◆ To force delete all applications: <code>slaptool -d -f -a -F</code> |
| -e | Performs an export rather than an import. |
| -r <object_name_ file> | Specifies a file containing line-delimited object names on which to perform the operation. |
| -o <object> | Specifies a particular object on which to operate. |
| [file] | <p>Specifies one or more <code>.XML</code> files from which to read data (or to write to for exporting). No file specification. It reads and writes data from and to the stdin and stdout.</p> <p>For example:</p> <pre>./slaptool.exe -o "cn=bernie, cn=netiq, dc=testdomain, dc=com" initial_setup.xml</pre> <p>This reads userIDs, applications, settings and password policies from the file <code>initial_setup.xml</code> and writes them out to the object:</p> <pre>"cn=bernie, cn=netiq, dc=testdomain, dc=com"</pre> |

| Command | Description |
|----------------------------|--|
| [App ID/ Credential ID] | <p>Specifies one or more application ID or credential ID in case of delete.</p> <p>If none is specified, all applications and credentials are deleted.</p> <p>For example:</p> <ul style="list-style-type: none"> ◆ To delete specific credential: <pre>slaptool -d -f -l <Credential ID></pre> ◆ To delete specific application: <pre>slaptool -d -f -a <App ID></pre> ◆ To delete all applications: <pre>slaptool -d -f -a</pre> |
| -P | Exclude Passphrase. |
| -k [password] | <p>Enables the creation of a passphrase answer for individual users in LDAP and Microsoft Active Directory environments.</p> <p>It is mandatory for users to save a passphrase answer on first log in to SecureLogin. The slAP tool requires password authorization to save user data. The -k switch provides the user password, enabling automated creation of the passphrase answer. This answer can be manually changed by users after provisioning.</p> <p>For example, the following command is used to import user data and a passphrase question and answer combination:</p> <pre>slaptool.exe -k password -o context filename.xml</pre> <p>This reads userIDs, applications, settings, and password policies from the file <code>initial_setup.xml</code> file and writes them out to the object: <code>"cn=writer,cn=netiq, dc=testdomain, dc=com"</code></p> |
| -I | Includes settings inherited from containers or groups. |

NOTE:

- ◆ If the -P switch was not used during the export operation, you must use -P or -k switch during the import operation.
- ◆ If -P switch was used during the export operation, then -P or -k switch is not required during the import operation.
- ◆ When using the slAP tool in the eDirectory mode and Novell Client is installed, use the following syntax:

```
slaptool <command option> -o <user DN in NDS format> -a
```

For example:

```
slaptool -d -o "abc.mytestou.novell" -a
```

Syntax of slAP Tool for Migrating to Advanced Edition

Using the slap tool you can migrate the data at the user-level or at the group-level.

- ♦ **At the user-level:** You can migrate the data using UPN of the user.
 - ♦ **Export:** `slaptool.exe -e -a -s -P -E <password> -S -f <path of the backup XML file>`
For example, `slaptool.exe -e -a -s -P -E xyz -S -f d:\nslbackup.xml`
 - ♦ **Import:** `slaptool.exe -E <password> -o "UPN" <path of the exported XML file>`
For example, `slaptool.exe -E xyz -o "migrate@nsl-test.xyz" d:\nslbackup.xml`
- ♦ **At the group-level:** You can migrate the data using GUID of the group. While migrating, you need to specify the object ID of the group instead of the group name.
 - ♦ **Export:** `slaptool.exe -e -a -s -P -E <password> -S -f <path of the backup XML file>`
For example, `slaptool.exe -e -a -s -P -E xyz -S -f d:\nslbackup.xml`
 - ♦ **Import:** `slaptool.exe -E <password> -o "GUID" <path of the exported XML file>`
For example, `slaptool.exe -E xyz -o "52926721-ce14-4b0a-b7ef-b1261282d24e" d:\nslbackup.xml`

slAP Tool Example

The following Perl application definition, created for the example organization discussed previously, assumes that user names and passwords are stored in a text file named `listofnames.txt`. There is one space between each username and password pair per line.

A XML file, such as the [“XML File Example” on page 116](#) is required to run this application definition, containing the data for import. Where the data is customized on a per user name basis, the string to be substituted is replaced with `*usernamegoeshere*`.

For example:

```

*****
open FILE,"listofnames.txt";
foreach (<FILE>) {
chomp;          # Clean string
@lines = split(/\n/); # Split up string
for each $l (@lines) {
    @fields = split(/\s/);
    $name = $fields[0];
    $pass = $fields[1];
    open DATAFILE,"source.xml";
    open OUTFILE,">data.xml";
    foreach (<DATAFILE>) { # Write up a file specific to this user
        s/\*usernamegoeshere\*/$name/;
        s/\*passwordgoeshere\*/$pass/;
        # Any other variable substitution can be done here too...
        print OUTFILE "$_";
    }
    close DATAFILE;
    close OUTFILE;
    system "slaptool.exe -k \"$pass\" -o
\"CN=$name.O=myorg.T=OURCOMPANY\" data.xml";
}
}
close FILE;
unlink 'data.xml';
*****

```

Using an XML file called `source.xml`, run the application definition with the data that is to be imported. For example, you can manually export data from a single user setup with the value for the username replaced with the string `*usernamegoeshere*`.

NOTE: The example application definition does not include error handling.

XML File Example

```

<?xml version="1.0"?>
<SecureLogin>
  <passphrasequestions>
    <question>Please enter a passphrase for SLAP testing.</question>
  </passphrasequestions>
  <passphrase>
    <activequestion>Please enter a passphrase for SLAP
testing.</activequestion>
    <answer>passphrase</answer>
  </passphrase>
  <logins>
    <login>
      <name>fnord</name>
      <symbol>
        <name>username</name>
        <value>bob</value>
      </symbol>
      <symbol>
        <name>Password</name>
        <value>test</value>
      </symbol>
    </login>
  </logins>
  <login>
    <name>notepad.exe</name>
    <symbol>
      <name>username</name>
      <value>asdf</value>
    </symbol>
  </login>

```

```
<symbol>
  <name>Password</name>
  <value>test</value>
</symbol>
</login>
<login>
  <name>testlogin</name>
  <symbol>
    <name>username</name>
    <value>Novell</value>
  </symbol>
  <symbol>
    <name>Password</name>
    <value>test</value>
  </symbol>
</login>
</logins>
</SecureLogin>
```

16 Migrating the Datastore Using the slMigrationHelper Tool

The `slMigrationHelper` tool migrates the data from an existing datastore to a new datastore. This tool is an enhanced version of the `slAP` tool and helps in the seamless migration with minimal disruption of service.

The data migrated during the migration process includes:

- ◆ User variables
- ◆ Application definitions
- ◆ Organizational settings
- ◆ Password policies
- ◆ Logins
- ◆ Passphrase questions and answers

The following are the benefits of using this tool:

- ◆ No need to install SecureLogin in a new mode: You only need to export the data from an existing installation and then import the data to configure SecureLogin with the new datastore.
- ◆ Single restart: You need to restart your workstation only once to complete the migration.
- ◆ Seamless migration: The entire process of exporting the data, reconfiguring SecureLogin to the new datastore, and importing the data is seamless and requires minimal manual intervention.
- ◆ No uninstallation required during migration: You can continue the migration process without uninstalling the existing SecureLogin installation. This results in minimal disruption of service.

In this Chapter

- ◆ [Datastores Supported for Migration](#)
- ◆ [Migrating the Datastore](#)

16.1 Datastores Supported for Migration

The migration is supported for the following datastores:

- ◆ Microsoft Active Directory
- ◆ eDirectory 887
- ◆ OpenLDAP
- ◆ Active Directory Application Mode (ADAM) or Active Directory Lightweight Directory Services (AD LDS)
- ◆ SecureLogin Advanced Edition (Azure Active Directory)
- ◆ NDS

16.2 Migrating the Datastore

The migration process involves the following two phases:

- ♦ **Migrating the administrator-managed settings:** If you want to decommission your existing datastore and move to another datastore, you need to migrate all settings, preferences, application definitions, password policies, logins with passwords, and other stored data.

First, you need to identify the shared configurations, such as containers and group policy settings, and how it will be fit in the structure of the new datastore. You can export this administrator-managed data using the tools similar to the existing process of distribution, and then import these to the new environment.

See [Distributing Configurations, Using the sIAP Tool](#), and [Managing Configurations \(SLManager\)](#).

- ♦ **Migrating the per-user settings:** The per user data, which is encrypted by the user is not transferable by an administrator without the user's keys to unlock it. Also as part of migration, the client application needs some reconfiguration where the data is stored via installer modification. The sIMigrationHelper tool performs these per user actions, running the process of exporting the data, reconfiguring the SecureLogin client to the new datastore, and importing the data. Users' inherited settings from containers or group/group policy are not migrated by default.

Perform the following steps to migrate the per-user settings by using the **sIMigrationHelper** tool:

- 1 Determine the following details:
 - ♦ Whether you want to upgrade from an earlier version and migrate or only migrate from one datastore to another in the same version of SecureLogin.
 - ♦ The type of the new datastore and any associated additional installer options, such as server address.
- 2 Go to the `SecureLogin\Tools\Administration\Provision Tools` folder.
- 3 Run the sIMigrationHelper tool with the following options as required:
 - ♦ The option to import the data automatically after login (requires HKLM access)
 - ♦ The option to specify where to export the users' encrypted data
 - ♦ The option to customize the password of the exported data
 - ♦ The option to exclude the passphrase in the migration

For more information about these options, see [Table 16-1 on page 121](#).

- 4 Based on the installer prompt, re-login or restart SecureLogin to load it in the new datastore mode.
- 5 If you did not choose to import the data automatically, run the tool again with the option to import all the data.

Table 16-1 *sIMigrationHelper* Options

| Option | Description |
|--|--|
| Migrate to the same version or upgrade to a later version | |
| -m | <p>Use this option to modify an existing SecureLogin installation.</p> <p>For example: If you are on eDirectory, run the following command to specify that the existing installation needs to be modified to run with a new datastore:</p> <pre>slmigrationhelper.exe -m [Datastore options]</pre> <p>You can also specify additional options during the modify process. For example, <code>slmigrationhelper.exe -m ADDLOCAL=SeamlessLDAPGina</code></p> |
| -u <path of the installer> | <p>Use this option to upgrade SecureLogin and change the datastore. To upgrade and change the datastore, use this option in combination with option <code>-t</code> to specify the new datastore.</p> <p>For example, <code>slmigrationhelper.exe -u <path of the 9.0 installer> -t [datastore]</code></p> <p>You can choose to upgrade to a newer version without changing the datastore.</p> <p>For example, <code>slmigrationhelper.exe -u <path of the 9.0 installer></code></p> <p>You can specify additional options during the upgrade or modify process.</p> <p>For example, <code>slmigrationhelper.exe -u <path of the 9.0 installer> ADDLOCAL=SeamlessLDAPGina</code></p> |
| Installer options | |
| -t <datastore> | <p>Use this option to specify the datastore you want to migrate to. This option is used in combination with option <code>-m</code>.</p> <p>The valid datastores are:</p> <ul style="list-style-type: none"> ◆ Microsoft Active Directory (AD) ◆ Active Directory Application Mode (ADAM) or Active Directory Lightweight Directory Services (AD LDS) ◆ LDAP <ul style="list-style-type: none"> IMPORTANT: Multiple options are available for seamless login in the LDAP mode: <ul style="list-style-type: none"> — Windows Login (Credential Provider): The SeamlessLDAPGina feature — Network provider credential manager (Post-login, before desktop): The SeamlessLDAPCred feature — On SecureLogin application launch: The LDAPApp feature ◆ LDAPSecretStore ◆ NDS ◆ SecureLogin Advanced Edition (Azure Active Directory) <ul style="list-style-type: none"> IMPORTANT: When you migrate to SecureLogin Advanced Edition (SLAE): <ul style="list-style-type: none"> — The seamlessMAD feature is installed automatically for the seamless login — SLAESERVERADDRESS is required — By default the value of SLAEPORT is TLS 443 — You can migrate to SLAE only from Active Directory or ADAM. Migration from SLAE to any other mode is not supported. <p>For examples, see “Example Commands for the -t Option” on page 123.</p> |

| Option | Description |
|--|--|
| -q | Use this option to run the installer in the quiet mode. By default, all installation program screens are displayed during the migration process. For example: <code>slmigrationhelper.exe -q</code> |
| Export options | |
| -f <path of the XML file> | Use this option to specify path to the file that will contain all the exported data. All the data is stored in the XML format. For example: <code>slmigrationhelper.exe - f <path of the file></code> |
| -E | Use this option to encrypt the exported data. If you do not specify a password, the default password <code>changeit</code> is used for encryption. For example: <code>slmigrationhelper.exe - E <password></code> |
| Import the exported user data manually or automatically | |
| -i <path to the XML file> | Use this option to import the previously exported data. For example: <code>slmigrationhelper.exe - i</code> |
| -r | Use this option to invoke importing of user data from the XML file. Using option updates HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\RunOnce. For example: <code>slmigrationhelper.exe -r</code> |
| Export/import option | |
| -P | Use this option to exclude import/export of passphrase information. If you have excluded passphrase import and export, during installation the user has to configure the passphrase information. For example: <code>slmigrationhelper.exe -m -f <path to the XML file> -P</code> |
| -I | Use this option to include settings inherited from containers or groups. For example, you can include or exclude the settings inherited from containers or groups as follows: <ul style="list-style-type: none"> ◆ To include: <pre>slmigrationhelper.exe -m -t SLAE -I</pre> ◆ To exclude: <pre>slmigrationhelper.exe -m -t SLAE</pre> |
| Help option | |
| -h | Use this option to display help for the <code>slmigrationhelper</code> tool. |

- ◆ [Example Commands for the -t Option](#)
- ◆ [Migrating from the SecretStore Mode to Other Modes](#)
- ◆ [Upgrading SecureLogin and Migrating the Datastore](#)

Example Commands for the -t Option

You can use the APPENDLOCAL property to add additional features to be installed.

For example, you can use the APPENDLOCAL command to add DAS and Syslog as additional features in the LDAP mode using the following command:

```
slmigrationhelper.exe -u C:\NetIQSecureLogin.exe -t LDAP
ADDLOCAL=SeamlessLDAPGina LDAPSERVERADDRESS=127.0.0.1
APPENDLOCAL=DAS, Syslog
```

NOTE: You can specify multiple comma-separated features as required in APPENDLOCAL. For more APPENDLOCAL commands, see the command options in the mode-specific sections in the [SecureLogin 9.1 Installation Guide](#).

Example commands for migrating to another modes:

- ♦ **To Migrate to the SLAE Mode:** You must provide the server address. Alternate port is optional and its default value is SSL 443.

```
slmigrationhelper.exe -m -t SLAE SLAESERVERADDRESS=10.198.1.2 /q
```

- ♦ **To Migrate to the LDAP or LDAPSecretStore Mode:** You must provide the server address. Consider the method of seamless login GINA/Cred Manager.

```
slmigrationhelper.exe -u <fullpath>\NetIQSecureLogin.exe -t LDAP
LDAPSERVERADDRESS=127.0.0.1 APPENDLOCAL=SeamlessLDAPCred
```

IMPORTANT: To include the additional NCI LDAP dependency, you might need to perform upgrade instead of migration.

| Scenario | Command |
|---|---|
| To switch to the LDAP mode and install in the GINA/Credential Provider mode | slmigrationhelper.exe -u C:\NetIQSecureLogin.exe -t LDAP ADDLOCAL=SeamlessLDAPGina |
| To switch to the LDAP mode and install in the Credential Manager mode | slmigrationhelper.exe -u C:\NetIQSecureLogin.exe -t LDAP -q ADDLOCAL=SeamlessLDAPCred |
| To switch to the LDAP mode and specify an LDAP server address | slmigrationhelper.exe -m -t LDAP LDAPSERVERADDRESS=127.0.0.1 |
| To specify additional features to be installed using the APPENDLOCAL property | slmigrationhelper.exe -m -t LDAP LDAPSERVERADDRESS=127.0.0.1 APPENDLOCAL=DAS |
| To Switch to the LDAPSecretStore and install in the Credential Manager mode | slmigrationhelper.exe -m -t LDAPSecretStore ADDLOCAL=SeamlessLDAPCred /q |

IMPORTANT: Installing in any LDAP or LDAPv3 mode requires NCI to be installed.

If you are modifying the datastore from an existing one to LDAP and NCI is not installed on your workstation, use the -u option to specify the path to SecureLogin installer.

For example: `slmigrationhelper.exe -u C:\NetIQSecureLogin.exe -t LDAP -q`
This switches the datastore to LDAP and installs NICI in the quiet mode.

♦ **To Migrate to the Microsoft Active Directory Mode:**

```
slmigrationhelper.exe -m -t MAD /q
```

♦ **To Migrate to the ADAM (AD LDS) Mode:**

```
slmigrationhelper.exe -m -t ADAM /q
```

♦ **To Migrate to the NDS Mode:**

```
slmigrationhelper.exe -m -t NDS /q
```

Migrating from the SecretStore Mode to Other Modes

In the subsequent release of SecureLogin, support for Secret Store will be discontinued. It is recommended to migrate from the SecretStore environment to one of the following modes:

- ♦ LDAP
- ♦ NDS

SecureLogin supports the following migration flows:

- ♦ [Migrating from LDAPSecretStore to LDAP](#)
- ♦ [Migrating from LDAPSecretStore to NDS](#)
- ♦ [Migrating from NDS SecretStore to NDS](#)

Migrating from LDAPSecretStore to LDAP

| Scenario | Use the command |
|---|---|
| To switch to the LDAP mode and install in the GINA/Credential Provider mode | <code>slmigrationhelper.exe -m -t LDAP ADDLOCAL=SeamlessLDAPGina /q</code> |
| To switch to the LDAP mode and install in the Credential Manager mode | <code>slmigrationhelper.exe -m -t LDAP ADDLOCAL=SeamlessLDAPCred /q</code> |
| To switch to the LDAP mode and specify an LDAP server address | <code>slmigrationhelper.exe -m -t LDAP LDAPSERVERADDRESS=127.0.0.1 /q</code> |
| To specify additional features to be installed using the APPENDLOCAL property | <code>slmigrationhelper.exe -m -t LDAP LDAPSERVERADDRESS=127.0.0.1 APPENDLOCAL=DAS</code> |

Migrating from LDAPSecretStore to NDS

To migrate to the NDS mode, use the following command:

```
slmigrationhelper.exe -m -t NDS /q
```

Migrating from NDS SecretStore to NDS

To migrate to the NDS mode, use the following command:

```
slmigrationhelper.exe -m -t NDS /q
```

Upgrading SecureLogin and Migrating the Datastore

If you want to upgrade SecureLogin and want to use another mode in the upgraded version, you must first upgrade SecureLogin to the latest version and then migrate it to the required mode. Performing the direct migration disables the features that you have enabled in the previous version.

Using ADDLOCAL overwrites the existing feature set. During upgrade, you can use ADDLOCAL, but it must be used with all features that are required.

You can use the APPENDLOCAL property to add additional features to be installed. However, this option does not work during the upgrade. It only migrates the features that are installed.

For example, you can use the APPENDLOCAL command to add DAS and Syslog as additional features in the LDAP mode using the following command:

```
slmigrationhelper.exe -u C:\NetIQSecureLogin.exe -t LDAP  
ADDLOCAL=SeamlessLDAPGina LDAPSERVERADDRESS=127.0.0.1  
APPENDLOCAL=DAS,Syslog
```

NOTE: You can specify multiple comma-separated features as required in APPENDLOCAL. For more APPENDLOCAL commands, see the command options in the mode-specific sections in the [SecureLogin 9.1 Installation Guide](#).

17 Managing the Workstation Cache

- ♦ [Section 17.1, “About the Workstation Cache,” on page 127](#)
- ♦ [Section 17.2, “Creating a Backup File,” on page 128](#)
- ♦ [Section 17.3, “Deleting the Workstation Cache,” on page 128](#)
- ♦ [Section 17.4, “Restoring the Local Cache Backup File,” on page 129](#)

17.1 About the Workstation Cache

The SecureLogin cache is an encrypted local copy of SecureLogin data. It allows users who are not connected to the network (or working offline using a laptop) to continue to use SecureLogin even if the directory becomes unavailable.

User data includes credentials, preferences, policies, and SecureLogin application definitions, except when you use a smart card for storing credentials. By default, a cache file is created on the workstation as part of SecureLogin installation. The cache file stores user data locally and is synchronized regularly with the user’s data in the directory. You can set the synchronization period in the Administrative Management utility. You can also disable the offline cache, forcing all SecureLogin data to be stored in the directory.

Depending on the type of installation, the cache is stored:

- ♦ In the users profile directory. For example:

`%APPDATA%\SecureLogin\Cache`

On Microsoft Windows Vista and higher: `%APPDATA%` represents

`C:\Users\<<Username>\Appdata\Roaming\`

On XP systems: `%APPDATA%` represents

`C:\Documents and Settings\<<Username>\Application Data\`

- ♦ In the `%ProgramFiles%`. For example:

`C:\Program Files\NetIQ\SecureLogin\Cache`

Directory and workstation caches are synchronized regularly, by default every five minutes, and whenever the user logs off or on to the workstation. When changes are made, either by the user on the workstation or the administrator in the directory, single sign-on user data is compared and updated during synchronization. Any settings configured by the user through the Credentials Management tool on the local workstation take precedence over those made in the directory.

If you require full administrative control of a user’s SecureLogin environment, you can disable the user’s access to administration tools through the settings in the Preferences Properties table. This prohibits users from overriding your changes while configuring changes on the workstation.

NOTE: The SecureLogin cache refresh interval is by default five minutes. You can change the default in the Preferences Properties table.

Because SecureLogin data is stored in the directory, existing directory backups also back up SecureLogin data. In addition, the local cache synchronizes with the directory for further redundancy of data. Backing up or restoring by using the SecureLogin menu options is typically performed by users who have been disconnected from the network for long periods of time, such as weeks or months.

Using workstation backup and restore, users can securely back up their SecureLogin cache in stand-alone or directory deployments. All user data, including passwords and passphrases, is saved in a password-protected, encrypted XML file.

17.2 Creating a Backup File

- 1 In the notification area, right-click the SecureLogin icon and select **Advanced > Backup User Information**. The Save Settings dialog box is displayed.
- 2 Select a folder to store the backup file. The file can be stored in any location.
- 3 In the **File name** field, specify a name for the backup file.
- 4 Click **Save**. The Password dialog box is displayed.
- 5 In the **Password** field, specify a password.

SecureLogin verifies if the password entered is at least 8 characters long. If the password does not meet this requirement then the user is prompted to re-enter the password with the required length.

- 6 Click **OK**.
- 7 Click **OK**.

17.3 Deleting the Workstation Cache

IMPORTANT: Before restoring the backup file, you must delete the cache file on the workstation. In directory environments, you must also delete the user object data in the directory.

- 1 Right-click the Windows **Start** button, then click **Explore**.
Ensure that you have selected `Show hidden files and folders` in the Windows Folder Options dialog box.
- 2 Depending on the type of installation, browse to `C:\Program Files\SecureLogin\Cache`
or
`%APPDATA%\SecureLogin\Cache`
On Microsoft Windows Vista, browse to
`C:\Users\<<Username>\Appdata\Roaming\SecureLogin\Cache`
- 3 Delete the cache directory.
- 4 Close Windows Explorer.

17.4 Restoring the Local Cache Backup File

- 1 In the notification area (system tray), right-click the SecureLogin icon, then select **Advanced > Restore User Information**.
- 2 Select the backup file.
- 3 Click **Open**. The Password dialog box is displayed.
- 4 In the **Password** field, specify the password.

If the specified password is correct, SecureLogin processes the file to restore the user's data. If one or more application are already defined, a series of messages asking the user whether to overwrite the existing workstation file, appears.
- 5 Select **Yes** to overwrite the file and continue restoring the local cache backup file.
- 6 After the completion of the restoration process, a confirmation message appears confirming that the cache is successfully loaded to the local workstation cache.

NOTE: If password policies already exist, ignore the wrong error message `0 password policy` that is shown when restoring user data.

18 AutoPass License Server

AutoPass License Server (APLS), is a Micro Focus web-based solution for managing your Micro Focus Software product licenses. It helps you organize and manage your product licenses, server users, and client users.

The AutoPass License Server manages the licenses acquired from the license portal. These licenses are then installed on the AutoPass License Server. When a client computer needs a license, the client sends a request to the AutoPass License Server and a license is checked out to this computer.

APLS uses the concurrent (floating) license model. A concurrent license is shared dynamically between multiple client users. The concurrent licenses are shared or pooled between a groups of users. Using concurrent licenses enables you to purchase the number of licenses equal to the largest number of users liable to be active at any time, instead of the total number of users of a product.

The AutoPass License Server manages the licenses acquired from the license portal. These licenses are then installed on the AutoPass License Server. When a client computer needs a license, the client sends a request to the AutoPass License Server and a license is checked out to this user.

On a concurrent license, after the client user's work session (or when the license expires), the license is returned to the AutoPass License Server for renewal or for use by other users.

Using the AutoPass License Server:

- ♦ Control and manage how the licenses are used
- ♦ Create and manage users who are responsible for administering the AutoPass License Server and the licenses installed on the server
- ♦ Manage client user access to the AutoPass License Server
- ♦ Centrally manage license /product /custom usage product-wise
- ♦ Generate reports for usage to manage pay per use billing

19 Auditing and Logging

- ♦ [Section 19.1, “About Auditing Tools,” on page 133](#)
- ♦ [Section 19.2, “About SNMP Auditing,” on page 133](#)
- ♦ [Section 19.3, “About Windows Event Log Alerts,” on page 133](#)
- ♦ [Section 19.4, “Creating a Windows Event Log Alert,” on page 133](#)
- ♦ [Section 19.5, “Logging Events,” on page 134](#)

19.1 About Auditing Tools

SecureLogin provides monitoring functionality with Simple Network Management Protocol (SNMP) trapping and Windows event logging. You can choose a preferred auditing application and to integrate event monitoring into your current SNMP functionality. Event alerts are activated through SecureLogin application definitions. An understanding of application definition is useful to enable event monitoring.

19.2 About SNMP Auditing

To understand how to use SecureLogin with SNMP, see [SecureLogin Guidelines for SNMP Trapping](#).

19.3 About Windows Event Log Alerts

Windows event log alerts are activated by following the same procedure as SNMP alerts. The `Logevent.exe` application is activated through the `Run` command in an application definition.

Windows event logging from SecureLogin requires that the Windows Event Log system is active on the computer receiving the alerts, along with the executable `Logevent.exe` on each audited client workstation, to generate the alerts.

NOTE: `Logevent.exe` is included in the Windows 2000 Resource Kit. Microsoft licensing regulations apply.

19.4 Creating a Windows Event Log Alert

The following procedure uses the Windows Notepad application as an example.

- 1 In the notification area (system tray), double-click to open the SecureLogin Client Utility.
- 2 Click **Applications**.
- 3 In the right pane, double-click the application description (in this example, Untitled-Notepad).
- 4 Click the **Definition** tab.

5 The command syntax to execute `LogEvent.exe` is:

```
logevent -m \\computername-s severity-c categorynumber-r source-e  
eventID-timeout"event text"
```

6 After `EndDialog`, specify the `LogEvent` command for the required alert.

For example:

```
Run "C:\Program Files\Resource Kit\LogEvent.exe -m SecureLogin -s -e  
99"Notepad has started"
```

This command requests an alert to be sent to the console with a security level of `W` – warning and event ID number 99.

7 Click **OK**.

8 Start Notepad. The alert is sent to the Windows Event Log system.

19.5 Logging Events

- ♦ [Section 19.5.1, “Enabling Logging Events from Browsers,” on page 134](#)
- ♦ [Section 19.5.2, “Enabling Logging Events from Embedded Web Browser,” on page 135](#)

19.5.1 Enabling Logging Events from Browsers

You can enable logging through one of the following ways:

- ♦ Native Logging from `SecureLogin`
- ♦ Browser Console

Native Logging from `SecureLogin`

To enable logging for browsers, create the following registry:

| Browser | Registry Path | Registry Type | Registry Name | Registry Value |
|-------------------|--|---------------|---------------|---------------------------------|
| Google Chrome | HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin | DWORD | Chromesso | Set the value of Chromesso to 0 |
| Microsoft Edge | HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin | DWORD | Edgesso | Set the value of Edgesso to 0 |
| Mozilla Firefox | HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin | DWORD | SLoMoz | Set the value of SLoMoz to 0 |
| Internet Explorer | HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin | DWORD | Iesso | Set the value of Iesso to 0 |

Browser Console

Perform the following steps to enable logging through browser console:

- 1 Navigate to the respective browser’s console.
- 2 Specify `log.setdefaultlevel(0);`

19.5.2 Enabling Logging Events from Embedded Web Browser

To enable logging for the embedded web browsers, create a registry:

- 1 Navigate to `HKEY_LOCAL_MACHINE\SOFTWARE\Protocom\SecureLogin`.
- 2 Create a `DWORD` registry called `iessobho`.
- 3 Set the value of `iessobho` to `2`.

20 Analytics Dashboard

NetIQ Access Manager Analytics Dashboard provides visual analytics of the access-related data based on usage, performance, and events.

SecureLogin integrates with Access Manager to use this dashboard. This dashboard helps in visualizing the access patterns, tuning the policies, and getting insights about the usage of SecureLogin in your environment. You can also monitor the real-time data access patterns to decide further actions.

Analytics Dashboard displays all required events in the form of graphs. The graphs are displayed in the following modes:

- ♦ **Real-time Data:** You can add filters or refresh the data after a specific time duration. You can view data from the time Analytics Dashboard is configured till the present time, but the data that is older than 7 days is not displayed. Refer [Section 20.7, “Set Time Range,” on page 142](#) to increase the time range.
- ♦ **Historic Data:** When you require the historic data, click **Dashboard > SecureLogin Historical Dashboard**. It has default time range of 6 months, which can be increased to a maximum of 365 days. Refer [Section 20.7, “Set Time Range,” on page 142](#) to increase the time range.

Analytics Dashboard displays the following graphs:

- ♦ [Section 20.5.1, “Count of Unique Users - Analytics \[SecureLogin\],” on page 140](#)
- ♦ [Section 20.5.2, “Data Table of Users - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.3, “Count of Workstations - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.4, “Data Table of Workstations - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.5, “Count of Applications SSO - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.6, “Data Table of Applications SSO - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.7, “Most Used SSO Applications - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.8, “Frequent SSO User of SecureLogin - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.9, “SecureLogin Application Usage Date Wise - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.10, “SecureLogin Disabled Users - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.11, “Count of Application Password Change - Analytics \[SecureLogin\],” on page 141](#)
- ♦ [Section 20.5.12, “Data Table of Application Password Changed - Analytics \[SecureLogin\],” on page 142](#)
- ♦ [Section 20.5.13, “Application Credentials Change - Analytics \[SecureLogin\],” on page 142](#)
- ♦ [Section 20.5.14, “Data Table of Application Credential Change - Analytics \[SecureLogin\],” on page 142](#)
- ♦ [Section 20.5.15, “Data Table of Users with Workstation Count - Analytics \[SecureLogin\],” on page 142](#)

In this Chapter

- ◆ Section 20.1, “Advantages of Using Analytics Dashboard,” on page 138
- ◆ Section 20.2, “Who Can Access Analytics Dashboard,” on page 138
- ◆ Section 20.3, “Getting Started with Analytics Dashboard,” on page 138
- ◆ Section 20.4, “Events for Each Graph,” on page 139
- ◆ Section 20.5, “Types of Graphs,” on page 140
- ◆ Section 20.6, “Managing Graph Limit,” on page 142
- ◆ Section 20.7, “Set Time Range,” on page 142

20.1 Advantages of Using Analytics Dashboard

- ◆ Displays visual analytics based on access patterns, logins, risk-based authentication, and usage of SecureLogin. This helps the administrators to tune the system according to their needs.
- ◆ Provides the trends of using devices, browsers, or applications in an organization.
- ◆ Provides the number of unique users who are logged in to SecureLogin.
- ◆ Displays the graphs in a full screen (kiosk) mode, which helps in viewing Analytics Dashboard in a data center. Also, it does not time out.
- ◆ Display a snapshot of the historic data graphs based on the query for any specific period.
- ◆ Analytics Dashboard can be used with older versions of SecureLogin. Users with NetIQ SecureLogin 9.0.0 Patch 1 and above get following improvements to the dashboard as compared to older releases:
 - ◆ Count of application SSO includes Windows application events.
 - ◆ NetIQ SecureLogin events created are logged with accurate timezone and year.

20.2 Who Can Access Analytics Dashboard

SecureLogin administrators can view and manage Analytics Dashboard.

20.3 Getting Started with Analytics Dashboard

Analytics Dashboard comprises of the following sections:

- ◆ **Recently viewed:** Contains the graphs that you have viewed recently.
- ◆ **Analytics Dashboard:** Contains the following options:
 - ◆ **Options:**
 - ◆ **Use margins between panels:** Specifies a margin of space between each pane.
 - ◆ **Show panel titles:** Specifies the appearance of titles in the header of each panel.
 - ◆ **Share:** To share the dashboard using **Snapshot** or **Saved objects**.

NOTE: It is recommended to take snapshots to avoid data loss. For more information, see [Snapshot and Restore](#) in the [NetIQ Access Manager 5.0 Administration Guide](#).

- ♦ **Add:** Create and add panels of your data to the dashboard, or add existing panels from the library.
- ♦ **Create New:** Use the following options:
 - ♦ To start with an empty dashboard, click **Create dashboard**.
 - ♦ To open an existing dashboard, click the dashboard Title you want to open.
- ♦ **Save:** To save the dashboard.
- ♦ **Cancel:** To cancel the changes made to the dashboard.
- ♦ **Discover:** Enables you to interactively explore the data.
- ♦ **Dashboard:** Provides visual analytics of access-related data based on the usage, performance, and events of SecureLogin.
- ♦ **Visualize:** Helps you visualize the captured data in the dashboard using the customizing view of the graphs.
- ♦ **Management:** Contains the following options:
 - ♦ **Dev Tools:** Provides tools to help you interact with the data.
 - ♦ **Stack Management:** Helps you manage every resource such as; indices, clusters, licenses, UI settings, index patterns, spaces present in the entire dashboard.

20.4 Events for Each Graph

The events are enabled by default. The following table provides the list of graphs with the required events:

Table 20-1

| Graph | Event | Event ID |
|---|--|----------|
| Count of Unique Users | SecureLogin Start Event | 256 |
| Data Table of Users | SecureLogin Start Event | 256 |
| Count of Workstations | SecureLogin Start Event | 256 |
| Data Table of Workstations | SecureLogin Start Event | 256 |
| Count of Applications SSO | Password provided by script | 514 |
| Data Table of Applications SSO | Password provided by script | 514 |
| Most Used SSO Applications | Password provided by script | 514 |
| Frequent SSO User of SecureLogin | Password provided by script | 514 |
| SecureLogin Application Usage Date Wise | Password provided by script | 514 |
| SecureLogin Disabled Users | SecureLogin disabled or inactive | 259 |
| Count of Application Password Change | Application password changed through SecureLogin | 515, 516 |

| Graph | Event | Event ID |
|---|---|---------------|
| Data Table of Application Password Changed | Application password changed through SecureLogin | 515, 516 |
| Application Credentials Change | Application credentials added, modified, or deleted through SecureLogin | 277, 278, 279 |
| Data Table of Application Credential Change | Application credentials added, modified, or deleted through SecureLogin | 277, 278, 279 |
| Data Table of Users with Workstations Count | SecureLogin Start Event | 256 |

20.5 Types of Graphs

The graphs represent the information about the business requirement of an organization. Analytics Dashboard displays the following graphs in real-time and historic data modes by default:

- ◆ [Section 20.5.1, “Count of Unique Users - Analytics \[SecureLogin\],” on page 140](#)
- ◆ [Section 20.5.2, “Data Table of Users - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.3, “Count of Workstations - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.4, “Data Table of Workstations - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.5, “Count of Applications SSO - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.6, “Data Table of Applications SSO - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.7, “Most Used SSO Applications - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.8, “Frequent SSO User of SecureLogin - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.9, “SecureLogin Application Usage Date Wise - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.10, “SecureLogin Disabled Users - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.11, “Count of Application Password Change - Analytics \[SecureLogin\],” on page 141](#)
- ◆ [Section 20.5.12, “Data Table of Application Password Changed - Analytics \[SecureLogin\],” on page 142](#)
- ◆ [Section 20.5.13, “Application Credentials Change - Analytics \[SecureLogin\],” on page 142](#)
- ◆ [Section 20.5.14, “Data Table of Application Credential Change - Analytics \[SecureLogin\],” on page 142](#)
- ◆ [Section 20.5.15, “Data Table of Users with Workstation Count - Analytics \[SecureLogin\],” on page 142](#)

20.5.1 Count of Unique Users - Analytics [SecureLogin]

This graph displays the count of unique users logged in to SecureLogin.

20.5.2 Data Table of Users - Analytics [SecureLogin]

This graph displays the list of unique users logged in to SecureLogin with access count.

20.5.3 Count of Workstations - Analytics [SecureLogin]

The graph displays the number of workstations where SecureLogin is being accessed.

20.5.4 Data Table of Workstations - Analytics [SecureLogin]

The graph displays the list of workstations where SecureLogin is being accessed.

20.5.5 Count of Applications SSO - Analytics [SecureLogin]

The graph displays the count of applications single signed-on by SecureLogin.

20.5.6 Data Table of Applications SSO - Analytics [SecureLogin]

The graph displays the list of applications and the number of times each application is single signed-on by SecureLogin.

20.5.7 Most Used SSO Applications - Analytics [SecureLogin]

The graph displays the top 10 applications single signed-on by SecureLogin.

20.5.8 Frequent SSO User of SecureLogin - Analytics [SecureLogin]

The graph displays the top 10 frequent users who use SecureLogin SSO for applications.

20.5.9 SecureLogin Application Usage Date Wise - Analytics [SecureLogin]

The graph displays the top 5 applications single signed-on by SecureLogin in 7 days.

20.5.10 SecureLogin Disabled Users - Analytics [SecureLogin]

The graph displays information about the users who have disabled SecureLogin in 7 days.

20.5.11 Count of Application Password Change - Analytics [SecureLogin]

The graph displays the number of applications passwords changed by SecureLogin.

20.5.12 Data Table of Application Password Changed - Analytics [SecureLogin]

The graph displays the list of applications whose password is changed by SecureLogin with change count.

20.5.13 Application Credentials Change - Analytics [SecureLogin]

The graph displays the top 10 applications credentials changed [Add/Modify/Delete] in 7 days.

20.5.14 Data Table of Application Credential Change - Analytics [SecureLogin]

The graph displays the list of applications credential changed [Add/Modify/Delete] with change count.

20.5.15 Data Table of Users with Workstation Count - Analytics [SecureLogin]

The graph displays information about the SecureLogin users who have logged in from multiple workstations.

20.6 Managing Graph Limit

The limits on the graphs can be increased as per the requirement of the user. Perform the following steps to increase the limit:

- 1 Select **Visualize**.
- 2 Search for the required metric in the search bar.
- 3 Under **Buckets**, click **Split Rows**.
- 4 Scroll to locate **Size** and update the limit as required.
- 5 Click **Update**.
- 6 Click **Save**.
- 7 Click **Save**.

NOTE: Ensure that **Save as new dashboard** toggle is set to close if you do not want to save the updated visualization as a new visualization.

20.7 Set Time Range

Perform the following steps to permanently set time range for dashboard:

1. Select the preferred time range in the dashboard.

2. Edit dashboard.
3. Click **Save**.
4. Set the **Store time with dashboard** toggle to on and click **Save**.

NOTE: Ensure that **Save as new dashboard** toggle is set to close if you do not want to save the updated visualization as new visualization.

21 Audit Configuration for Sentinel

SecureLogin integrates with NetIQ Sentinel for auditing. The events are logged to Windows Event Log from which the auditing server such as NetIQ Sentinel can fetch the event logs. In the previous releases the connection to the auditing server was outbound. That is, the Platform Agents sent the event logs to the Novell Audit.

In SecureLogin, the connection to the auditing server is inbound. The events are logged to Windows Events Log from where the auditing server fetches the event logs.

- ♦ [Section 21.1, “Windows Event Log: An Overview,” on page 145](#)
- ♦ [Section 21.2, “WMS Connector,” on page 145](#)
- ♦ [Section 21.3, “Configuring Auditing,” on page 145](#)
- ♦ [Section 21.4, “Logging Events from LDAP,” on page 148](#)

21.1 Windows Event Log: An Overview

Windows event logging is a system service used by the Windows operating system to record the occurrence of system events. Events range from resource tracking of failing device drivers to security-related actions such as attempts to access files, directories, printers, or other system objects that are under audit control. The Windows security event log monitors events generated by system security and auditing processes.

By default, **Windows Security Event Auditing** is turned off. The Windows Event Viewer is the primary tool for viewing the event logs found on Windows systems.

21.2 WMS Connector

The Windows Monitoring Service (WMS) connector facilitates integration between Sentinel Collectors with Microsoft Windows event sources. For SecureLogin, we use the SecureLogin Collector. The collector is available at [Sentinel Connector and Collector Web site](#).

For information, see [Understanding Event Source Management](#) in [Sentinel User Guide](#).

21.3 Configuring Auditing

The configuration of auditing, with the SecureLogin Collector, differs for workstations in Active Directory environments and non-Active Directory environments. The configuration involves enabling audit for the target system and configuration of the appropriate accounts to access the Windows Event Logs remotely by Sentinel. For more information, see the WMS Connector ([Sentinel Connector and Collector](#)).

- ♦ [Section 21.3.1, “Monitoring a System in a Domain Environment,” on page 146](#)
- ♦ [Section 21.3.2, “Monitoring a System in a Non-Domain Environment,” on page 147](#)

21.3.1 Monitoring a System in a Domain Environment

In a domain environment, a domain account must be created that has the policy rights to access the Windows Security Event logs on the remote Event Sources. This domain user account must be recognized by the Event Sources either as a user within the domain, or a user within one of the groups referenced on the server.

- ♦ [“Configuring Events Logged by Windows Event Log” on page 146](#)
- ♦ [“Configuring Users to Collect Windows Event Log Remotely” on page 146](#)
- ♦ [“Setting up the Windows Management Instrumentation Service” on page 147](#)
- ♦ [“Configuring Domain Account User COM/DCOM” on page 147](#)

Configuring Events Logged by Windows Event Log

Use the following procedure to enable basic Windows event logging for use with Windows Collectors. To collect data from a different application that writes to the Windows Event Log, refer to the documentation for the associated Collector. See the [Sentinel Connector and Collector website](#).

To configure the Sensor to report Events to Security Log:

- 1 Log on to Windows with an account that has Administrative rights.
- 2 Click **Start > Settings > Control Panel**.
- 3 In Control Panel window, double-click **Administrative Tools**.
- 4 Double-click **Local Security Policy**; expand **Local Policies**, then double-click **Audit Policy**.
- 5 Double-click a specific audit policy to edit the security settings.
- 6 In Local Security Setting window, select **Success/Failure**.
- 7 Click **OK**.

Configuring Users to Collect Windows Event Log Remotely

- 1 From the **Event Source**, click **Start > Settings > Control Panel**.
- 2 In the Control Panel window, select **Administrative Tools > Local Security Policy > Local Policies > User Rights Assignment > Manage auditing and security log**.
- 3 Click **Add**.
- 4 In **Select Users/Groups**, click **Look in field** and select the domain with the account to be used for collecting the security event log information.
- 5 Double-click the account to be used, then click **OK**.
- 6 In the Local Security Policy Settings window, click **OK**.

The new policy setting takes effect after you restart the system.

NOTE: If domain-level policy settings are defined, they override local policy settings.

Setting up the Windows Management Instrumentation Service

- 1 Log in to the remote computer and click **Start > Settings > Control Panel**.
- 2 In the Control Panel window, double-click **Administrative Tools > Computer Management**.
- 3 In the Computer Management window, on the **Tree** tab expand **Services and Applications**; right-click **WMI Control**, then select **Properties**.
- 4 In WMI Control Properties window, select the **Security** tab.
- 5 Select the **Root** folder, then click **Security** to open the Security for Root dialog.
If the User or Group that needs the remote WMI access does not appear in the list, click **Add**.
- 6 From the Select Users, Computers, or Groups window, select the user or group that needs remote WMI access, then click **Add**.
- 7 After you finish selecting users or groups, click **OK**.
- 8 Select the newly added user or group and ensure that they have at least the following permissions depending on what type of Event log you want to access:
 - ◆ Execute Methods
 - ◆ Provider Write
 - ◆ Enable Account
 - ◆ Remote Enable
- 9 With the user or group still highlighted, click **Advanced**.
- 10 Select the group, then click **View/Edit**, to open the Permission Entry for Root dialog.
- 11 From the **Apply onto** list, select **This namespace and sub namespaces**.
- 12 Click **OK** on each dialog until you return to the Computer Management window.
- 13 Restart the WMI service. See [Starting and Stopping the WMI Service](#).

Configuring Domain Account User COM/DCOM

The procedure to configure domain account user COM/DCOM differs based on the platform on the SecureLogin workstation. See the WMS Connector document ([Sentinel Connector and Collector](#)).

21.3.2 Monitoring a System in a Non-Domain Environment

In a non-domain environment, local accounts must be created on both the Collector Manager system and on the Event Source. These accounts must have the same username and password.

- ◆ [“Configuring Events Logged by Windows Event Log” on page 147](#)
- ◆ [“Configuring Users to Collect Windows Event Log Remotely” on page 148](#)
- ◆ [“Setting up the Windows Management Instrumentation Service” on page 148](#)
- ◆ [“Configuring Domain Account User COM/DCOM” on page 148](#)

Configuring Events Logged by Windows Event Log

See [“Configuring Events Logged by Windows Event Log” on page 146](#).

Configuring Users to Collect Windows Event Log Remotely

In a non-Active Directory environment, you must create a user account on each event source, that is, each workstation running SecureLogin. This same username and password must be configured on the Collector Manager machine. On Collector Manager machine, this user must be part of Administrator group. See [“Configuring Users to Collect Windows Event Log Remotely” on page 146.](#)

Setting up the Windows Management Instrumentation Service

See [“Setting up the Windows Management Instrumentation Service” on page 147.](#)

Configuring Domain Account User COM/DCOM

See [“Configuring Domain Account User COM/DCOM” on page 147.](#)

21.4 Logging Events from LDAP

You must configure the registry to enable logging from LDAP.

- 1 Create a registry value at `HKEY_LOCAL_MACHINE\Software\Novell\Login\Ldap`

The following events are logged:

Event ID 1 Informational: NSL user login

Event ID 2 Informational: LDAP user password change

Event ID 3 Warning: Workstation unlocked by different User

- 2 Open `nslevtsvc.ini` in a text editor and add the following section about the new information source:

```
[wmi]
event_source=LDAPAuth
```

The following events are logged:

Event ID 1 Informational: NSL user login

Event ID 2 Informational: LDAP user password change

Event ID 3 Warning: Workstation unlocked by different User

22 Administering Desktop Automation Services

The module `ARS.exe` is the primary component of Desktop Automation Services. Configuration of the service is performed through the use of an XML file. The XML document can be obtained either locally on the workstation or through directory services. The XML document is called the action file and the file is named `actions.xml`.

See an example file in [Section 22.3, “Example of an Action File,”](#) on page 172.

Each action is a set of configurable user-level operations such as mapping a drive, testing for an authenticated connection to a directory, and even running/ shutting down an application. The flexibility of the code to test for conditions and have the action triggers such as hot keys, provide tremendous flexibility to change the behavior of the workstation to fit your needs.

The `ARSControl.exe` runs as a Windows service. The `ARSControl.exe` then parses the `actions.xml` file and stores the configuration in memory. All actions performed by `ARS.exe` and `ARSControl.exe` are recorded in a `DASlog.txt` log file at different configurable levels of details.

After you configure the `ARS.exe` application, its actions are available individually or in combination with the scripting interface that is available on Windows. For example, VBScript, JavaScript, login scripts, SecureLogin scripts, and batch files.

- ♦ [Section 22.1, “Actions and Descriptions,”](#) on page 149
- ♦ [Section 22.2, “Using the DAS Editor to Configure Actions,”](#) on page 170
- ♦ [Section 22.3, “Example of an Action File,”](#) on page 172

22.1 Actions and Descriptions

Each instance of Desktop Automation Services is configured by an XML document that defines events and desired actions.

The following table describes the elements that might be used to compose a Desktop Automation Services XML input document. Unless otherwise specified, all XML attributes listed for a given element are required for that element.

Table 22-1 Desktop Automation Services XML Description

| XML Tags | Description |
|---------------------------|--|
| application-runner-script | <p>This is the parent element for an Desktop Automation Services input document.</p> <p>application-runner-script has no attributes.</p> <p>application-runner-script can contain any number of action elements.</p> <p>For Example:</p> <pre><?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <run-application application= "notepad.exe" interval="500" serial="true" parameters="" /> </action> <action-triggers> <on-inactivity-timer interval1="100" messagebox="Your " interval2="8" action-name="sample-action"/> </action-triggers> </application-runner-script></pre> |
| action-triggers | <p>This element is a parent (container) for action-trigger elements such as on-nds-login, or on-hot-key.</p> <p>action-triggers enables Desktop Automation Services executables to respond to workstation events by triggering specified actions as defined in the input document.</p> <p>action-triggers has no attributes.</p> <p>action-triggers can contain any of the following child elements:</p> <ul style="list-style-type: none">◆ on-inactivity-timer◆ on-nds-login◆ on-ldap-login◆ on-hot-key◆ on-screen-saver◆ on-cardmon◆ on-Tap-cardmon◆ on-ad-login <p>For example:</p> <pre><action-triggers> <on-nds-login action-name="LoginInAction" tree="NCCD_TREE_1"/> </action-triggers></pre> |

| action | <p>This is the parent element for all the commands that constitute an action.</p> <p>action has two attributes:</p> <p>name: The name can be any arbitrary string value. The character case in the name used by a caller to invoke an action must match the case used where the action is defined. The action-name must be contained in double quotes.</p> <p>multi-delay: This command element specifies the interval in executing the same action, twice.</p> <p>For Example:</p> <pre data-bbox="537 585 1435 785"> <?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <action name="ctrl+l" multi-delay="4000"> </action> </application-runner-script> </pre> <p>action can contain any number of the following child elements:</p> <ul data-bbox="561 856 964 1381" style="list-style-type: none"> ◆ Hide-Desktop and Unhide-Desktop ◆ run-application ◆ test-app-running ◆ kill-app ◆ kill-all-apps ◆ map-drive ◆ map-home-drive ◆ map-location-drive ◆ test-logged-in ◆ test-ldap-logged-in ◆ test-ad-logged-in ◆ ad-logout ◆ nds-logout ◆ ldap-logout ◆ screen-saver-on <p>For example:</p> <pre data-bbox="537 1465 1422 1629"> <?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <map-drive drive-letter="o:" remote-name="//192.168.1.255/sys"/> </action> </application-runner-script> </pre> |

| XML Tags | Description |
|---------------------|---|
| on-inactivity-timer | <p>on-inactivity-timer has four attributes:</p> <ul style="list-style-type: none"> ◆ interval1: is the time of executing an action ◆ interval2: is the time after which warning dialog will be displayed. ◆ messagebox: contains the message to be displayed in the warning. <p>This command element provides information to Desktop Automation Services on the action to be performed if the workstation is inactive for more than the specified period of time.</p> <p>At the end of the countdown period, a specified action such as <code>Close all programs</code> or <code>Lock the Workstation</code> can be invoked. If a mouse or keyboard action is detected, the countdown timer stops and resets until the next inactivity is detected.</p> <p>For Example:</p> <pre data-bbox="537 716 1349 1188"> <?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <run-application application="notepad.exe" interval="500" serial="true" parameters="" /> </action> <action-triggers> <on-inactivity-timer interval1="100" message box="Your" interval2="8" action-name="sample-action"/> </action-triggers> </application-runner-script> </pre> <ul style="list-style-type: none"> ◆ interval1 is the time of executing an action. ◆ interval2 is the time after which warning dialog will be displayed. ◆ messagebox contains the message to be displayed in the warning. ◆ action-name is the name of the action to be executed. <p>Specify the inactivity timer in seconds. For example, 10 seconds.</p> <p>NOTE: You must specify only numbers for interval values in the syntax. If you use special characters in the <code>action.xml</code> file, it does not behave as expected.</p> <p>The <code>on-inactivity-timer</code> is implemented to work with positive numbers. If a negative number or special character is specified, it will behave erroneously.</p> <p>The <code>on-inactivity-timer</code> functions only if the network login is present.</p> |

| XML Tags | Description |
|---------------|---|
| on-nds-login | <p>This element defines an action trigger that is activated when a user logs in to eDirectory through the Novell Client GINA/Credential Provider. If a user logs in to the tree, an action trigger invokes Desktop Automation Services. It tests the primary connection to see if the current tree matches the configuration. If it matches, Desktop Automation Services executes the configured action identified by the action name attribute value.</p> <p>on-nds-login element must be contained within an action-triggers parent element.</p> <p>on-nds-login has two attributes:</p> <ul style="list-style-type: none"> ◆ action-name: The name of an action defined in the input document that is executed when a user logs in to the tree named by the tree attribute. The action-name must be contained in double quotes. ◆ tree: Connections are tested periodically to see if they are linked to the tree named by this network name. The tree name must be contained in double quotes. <p>For example:</p> <pre data-bbox="537 837 1208 1003"> <action-triggers> <on-nds-login action-name="LoginInAction" tree="NCCD_TREE_1"/> </action-triggers> </pre> |
| on-ldap-login | <p>This element defines an action trigger that is activated when a user logs in to eDirectory through SecureLogin's LDAP client.</p> <p>Desktop Automation Services tests the primary connection to check whether the current server matches the server attribute specified in the configuration. If the current server matches the configuration, Desktop Automation Services executes the configured action identified by the action-name attribute value.</p> <p>on-ldap-login must be contained by an action-triggers parent element.</p> <p>on-ldap-login has two attributes:</p> <ul style="list-style-type: none"> ◆ server: The connections are tested periodically to test if the user is connected to a server matching this element name. ◆ action-name: The name of an action defined in the input document that is executed when a user logs in to the tree named by the tree attribute. <p>For example:</p> <pre data-bbox="537 1587 1224 1759"> <action-triggers> <on-ldap-login action-name="LoginInAction" server="192.168.1.255"/> </action-triggers> </pre> <p>NOTE: Ensure that the server address matches the LDAP Server address provided during installation.</p> |

| XML Tags | Description |
|------------|---|
| on-hot-key | <p>This element defines an action trigger to respond to the user typing the specified hot key sequence. This causes Desktop Automation Services to execute the matching action as defined in the input document. The <code>on-hot-key</code> elements must be contained within an <code>action-trigger</code> parent element.</p> <p><code>on-hot-key</code> has three attributes:</p> <ul style="list-style-type: none"> ◆ virtual-key: The hex value of the key based on the virtual key map. This element specifies that it is the second component of the hot key sequence. ◆ modifiers: The modifiers indicate the keys that are pressed in together with the virtual key to cause the hot-key event. The hex value might be a combination of one or more of the following, separated by a plus sign (+): <ul style="list-style-type: none"> ◆ alt indicates the Alt key ◆ ctrl indicates the Ctrl key ◆ shift indicates the Shift key ◆ win indicates the Windows key <p>This element specifies that it is the first component of the hot key sequence.</p> ◆ action-name: The name of an action defined in the input document that is executed when the hot-key sequence is detected. <p>For example:</p> <pre data-bbox="537 936 1425 1050"><action-triggers> <on-hot-key virtual-key="h" modifiers="ctrl+shift" action-name="HKeyAction"/> </action-triggers></pre> <p>A virtual-key value of 'h' and a modifiers value of 'ctrl+shift' produces a Control-Shift-H HotKey sequence.</p> |

| XML Tags | Description |
|-----------------|--|
| on-screen-saver | <p>This element causes an action to be called when the workstation enters the screensaver mode. <code>on-screen-saver</code> elements must be contained by an <code>action-trigger</code> parent element.</p> <p><code>on-screen-saver</code> has the following attributes:</p> <ul style="list-style-type: none"> ◆ action-name: The name of the action defined in the input document that is executed when the workstation has entered the screensaver mode and the specified interval has elapsed. ◆ interval: The amount of time in milliseconds that the ARSControl waits before running the specified action after a screensaver event is triggered. <p>NOTE: To activate this trigger, you must have a Windows system screen saver selected. Set the screen saver wait time to the desired time interval before the workstation activates the screen saver. If you are using DAS to activate the screen saver through the <code>on-inactivity-timer</code> action trigger, set the wait time to a longer timer interval than what you set for the <code>on-inactivity-timer</code> action trigger. For example, you can set the <code>on-inactivity-timer</code> interval to 60 minutes. The screen saver is triggered from DAS on the shared workstation.</p> <p>For example:</p> |
| | <pre data-bbox="537 884 1382 968"><action-triggers> <on-screen-saver action-name="logoff" interval="60000"/> </action-triggers></pre> |
| | <p>This results in the logoff action being executed 60 seconds after the Windows screen saver is activated.</p> |
| on-cardmon | <p>The <code>on-cardmon</code> element specifies the action to be performed when a smart card is inserted, removed or when it is used for the login to the directory. If a user is logged in through a smart card and logs out because of a security reason, a specific action like a system lock must be performed to ensure that the workstation security is not at risk.</p> <p><code>on-cardmon</code> must be contained within an <code>action-trigger</code> parent element.</p> <p><code>on-cardmon</code> has the following attributes:</p> <ul style="list-style-type: none"> ◆ action-name: The name of the action defined in the input document that is executed when the card is removed from the reader. ◆ card-insert: The name of the action defined in the input document that is executed when the card is inserted to the reader. ◆ LoginAction: The name of the action defined in the input document that is executed when the user successfully logs into the Directory. <p>If the login action fails <code>card-insert</code> action is repeated again.</p> <p>For example:</p> |
| | <pre data-bbox="537 1682 1382 1843"><action-triggers> <on-cardmon action-name="Removal" card-insert="Insertion" LoginAction = "unHideMe" /> </action-triggers></pre> |

| XML Tags | Description |
|---------------------------------|---|
| on-Tap-cardmon | <p>The on-Tap-cardmon element specifies the action to be performed when a contactless smart card is tapped on and tapped out, or when it is used for the login to the directory. If a user is logged in through a smart card and logs out because of a security reason, a specific action like a system lock must be performed to ensure that the workstation security is not at risk.</p> <p>The on-Tap-cardmon element must be contained within an action-trigger parent element.</p> <p>on-Tap-cardmon has the following attributes:</p> <ul style="list-style-type: none"> ◆ action-name: The name of the action defined in the input document that is executed when the card is tapped out from the reader. ◆ card-tapon: The name of the action defined in the input document that is executed when the card is tapped on to the reader. ◆ LoginAction: The name of the action defined in the input document that is executed when the user successfully logs into the Directory. If the login action fails card-tapon action is repeated again. ◆ TapCardSwitchUser: This attribute is used to restrict the card tap to switch users in the kiosk mode. If this attribute value is set to true, then single card tap is required to switch the user in kiosk mode. If this attribute value is set to false, then double card tap is required to switch the user in kiosk mode. |
| on-ad-login | <p>This element defines an action trigger to poll for a user logging in to a workstation, in the Active Directory domain.</p> <p>This support is for SecureLogin installed in the Active Directory mode. If a user logs in to Active Directory, an action trigger invokes Desktop Automation Services which in turn executes the configured action identified by the action-name. on-ad-login element must be contained within the parent element, action-triggers.</p> |
| Hide-Desktop and Unhide-Desktop | <p>The Hide-Desktop and Unhide-Desktop actions will hide or show the items on the user's desktop. These commands can be used with the on-login element to disable the users desktop prior to login and then to enable the desktop when the user login has been completed.</p> <p>NOTE: These actions are primarily for a kiosk approach without role-based access or for workstation policies managed through ZENworks® syntax. If you specify special characters in the action.xml file, it does not behave as expected.</p> |

| XML Tags | Description |
|-----------------|--|
| run-application | <p>This command element provides information that enables Desktop Automation Services to run an application and respond when the application is closed. There are four required attributes and one optional attribute. Following are the required attributes:</p> <ul style="list-style-type: none"> ◆ application: The name of the application to launch, such as <code>notepad.exe</code>. For applications that the operating system cannot find through the configured path environment variable, specify the complete application path and file extension. ◆ parameters: Lists the required parameters to be passed to the application. This attribute should have text values enclosed within double quotes (<code>""</code>). ◆ serial: This attribute defines the application to run in synchronous or asynchronous mode. The attribute value can be either <code>true</code> or <code>false</code>. When this attribute is set to <code>true</code> (in synchronous mode), then the execution of the parent action does not continue until the application is closed or the interval timeout has expired. ◆ interval: The timeout interval is used only used when the serial attribute is set to <code>true</code> (synchronous mode). If the application has not returned by the specified timeout, Desktop Automation Services stops waiting for a return and executes the next action. <p>The following is an optional attribute:</p> <p>on-exit-action: When the application started by this element is closed, the specified action is called.</p> <p>run-application cannot have any child elements.</p> <p>For example:</p> <pre data-bbox="537 1087 1360 1304"><?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <run-application application="C:\Program Files\Mozilla Firefox\firefox.exe" parameters="" on-exit- action="launchSomethingElseAction"serial="true" interval="500"/> </action> </application-runner-script></pre> |

| XML Tags | Description |
|------------------|---|
| test-app-running | <p>The test-app-running command element provides information that enables Desktop Automation Services to test whether an application is running or not. .</p> <p>test-app-running can have only one attribute:</p> <p>application: The name of the application as it is found in the process list.</p> <p>Because test-app-running is a test command, it can contain either one or both of the following child elements:</p> <ul style="list-style-type: none"> ◆ if-true: An element containing the command operations to perform if the test returns a true value. ◆ if-false: An element containing the command operations to perform if the test returns a false value. <p>For example:</p> <pre data-bbox="537 699 1398 1125"> <?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <test-app-running application="notepad.exe"> <if-true> <kill-app application="xmlspy.exe"/> <kill-all-apps exclude-apps="notepad.exe:xmlspy.exe"/> <map-drive drive-letter="F:" remote- name="\172.16.5.250\sys"/> </if-true> <if-false> <map-drive drive-letter="G:" remote- name="\192.168.1.255\sys"/> </if-false> </test-app-running> </action> </application-runner-script> </pre> |
| kill-app | <p>The kill-app command element provides information that enables Desktop Automation Services to close an application.</p> <p>kill-app has one required attribute and one optional attribute.</p> <p>The following is the required attribute:</p> <ul style="list-style-type: none"> ◆ application: The name of the application to close, as found in the process list. <p>The following is the optional attribute:</p> <ul style="list-style-type: none"> ◆ interval: The amount of time in milliseconds that Desktop Automation Services waits after sending a close command to the application before killing the process. The default interval value is 1000. <p>kill-app cannot contain any child element.</p> <p>For Example:</p> <pre data-bbox="537 1677 1438 1877"> <?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd"> <application-runner-script> <action name="sample-action"> <kill-app application="xmlspy.exe"/> </action> </application-runner-script> </pre> |

| test-nds-attr-val | This test command element provides information that enables Desktop Automation Services to test whether or not the currently logged in users NDS account contains a particular directory attribute with a particular value. |

test-nds-attr-val has four required attributes:

- ◆ **tree:** The name or IP address of the tree containing the user account to be searched for the attribute value.
- ◆ **attr-name:** The name of the attribute to be tested in the NDS account.
- ◆ **attr-syntax:** The syntax of the attribute to be tested in the NDS account.
The acceptable attr-syntaxes are:
 - ◆ string
 - ◆ integer
 - ◆ boolean
- ◆ **attr-val:** The value to be searched in the target attribute in the NDS account. The values for the Boolean syntax attribute must be either true or false.

NOTE: If the attribute syntax is string, then the comparison between the value retrieved from the eDirectory and the value of the attr-val is case sensitive.

Because the test-nds-attr-val is a test command, it can contain either or both of the following child elements:

- ◆ **if-true:** An element containing the command operations to perform if the test returns a true value.
- ◆ **if-false:** An element containing the command operations to perform if the test returns a false value.

For Example:

```
<?xml version="1.0"?><!DOCTYPE application-runner-script SYSTEM
"ARS_1.0.dtd">
<application-runner-script>
  <action name="sample-action1">
    <test-nds-attr-val tree="TestTree" attr-name="cn" attr-
syntax="string" attr-val="larry">
      <if-true>
        <kill-app application="george.exe"/>
        <run-application application="fred.exe"
parameters="" serial="true" interval="250"/>
      </if-true>
      <if-false>
        <map-drive drive-letter="S:" remote-
name="//172.16.5.253/sys"/>
      </if-false>
    </test-nds-attr-val>
  </action>
  <action name="sample-action2">
    <test-nds-attr-val tree="TestTree" attr-name="Password
Minimum Length" attr-syntax="integer" attr-val="5">
      <if-true>
        <!â€"any commands may be inserted here-->
      </if-true>
      <if-false>
        <!â€"any commands may be inserted here-->
      </if-false>
    </test-nds-attr-val>
  </action>
  <action name="sample-action3">
    <test-nds-attr-val tree="TestTree" attr-name="Password
Required" attr-syntax="boolean" attr-val="true">
```

22.2 Using the DAS Editor to Configure Actions

Each instance of DAS is driven by an XML document describing the actions that are available.

The DAS Editor helps you in composing an action. The wizard tool is available in \SecureLogin\Tools\ DAS Editor folder on the SecureLogin CD image.

The DAS Wizard provides an ability to create and modify a configuration file. The wizard helps you create the configuration with the correct XML format.

- ♦ If you are using the DAS Wizard to create the configuration file, select actions and triggers applicable for DAS.
- ♦ The DTD file must be stored in the same location as the XML file. The DTD file validates XML.

Creating a New Configuration File

- 1 Run the `DASWizard.exe` available in the `\SecureLogin\Tools\DAS Editor` folder of the SecureLogin executables. The wizard is launched.
- 2 Right-click on the action header and select **Insert Action**.
- 3 Specify a name for the action and press Enter. For example, `WSAction`.
- 4 Define a child element for the action that was created.

Right-click the action you added, click **Insert Element**, and select the child element. For example, `map-drive`.

Note that the Editor will only list the DAS actions that are valid for child elements.

NOTE: The Editor lists only the DAS actions that are valid for child elements.

- 5 Specify the attributes for the child element you defined in [Step 4](#). Note that not all of the child elements have attributes. For example, `nds-logout` or `show-desktop` does not have any required attributes.
For example, if you selected `map-drive` in [Step 4](#), specify the drive letter and the UNC path to be mapped.
- 6 To add a trigger to the action you have created, right-click on the header trigger, followed by selecting **Insert trigger**. The Editor will display a list of valid triggers that can be selected. Select the desired trigger.
- 7 Specify the attributes for the trigger you selected.
- 8 The configuration specified is saved to a new text file in the required XML format.

The DTD file must be copied to the same location as the xml file that you want to edit. If you create a new configuration file by following the previous steps and require to open the file for further editing, then you need to copy the DTD file to the same location. Creating a new configuration file uses the DTD file from the DAS Editor folder for validation of the XML syntax. If the DTD file is not located the following error message is displayed:

```
Error Loading XML
Error 0x800c0006 on line x, position x
Reason: The system cannot locate the object specified.
Error processing resource 'ARS_1.0.dtd'.
```

22.3 Example of an Action File

The following XML file contains examples of most of the XML elements that can be used to compose action sequences in Desktop Automation Services.

```
<application-runner-script>
  <action name="startup">
    <test-app-running application="sltray.exe">
      <if-true>
      </if-true>
      <if-false>
        <hide-desktop/>
        <run-application application="sltray.exe" parameters="" on-exit-
action="restartNSL" serial="true" interval="500"/>
      </if-false>
    </test-app-running>
  </action>
  <action name="restartNSL">
    <test-app-running application="sltray.exe">
      <pause interval="500"/>
      <if-true>
      </if-true>
      <if-false>
        <run-application application="sltray.exe" parameters="" on-exit-
action="restartNSL" serial="true" interval="500"/>
      </if-false>
    </test-app-running>
  </action>
  <action name="loggedin">
    <pause interval="1000"/>
    <unhide-desktop/>
    <!-- Starting the chrome browser with the url mention in the parameters -->
    <run-application application="chrome.exe" parameters="https://www.msdn.com" on-
exit-action="" serial="true" interval="500"/>
  </action>

  <action name="logoff">
    <!-- <message-box caption="logoff" window-name="Session logoff"/> -->
    <pause interval="2000" />
    <ad-logout/>
    <pause interval="1000" /> <!-- delay for NSL to successfully shutdown
-->
    <kill-app application="chrome.exe"/>
    <hide-desktop/>
    <run-application application="sltray.exe" parameters="" on-exit-
action="restartNSL" serial="true" interval="500"/>

  </action>

<action-triggers>
  <!-- action executed when user logs in to AD through SecureLogin -->
  <on-ad-login action-name="loggedin"/>
  <on-hot-key modifiers="ctrl" virtual-key="l" action-name="logoff"/>
  <on-hot-key modifiers="ctrl" virtual-key="s" action-name="loggedin"/>
  <!-- This is for contactless smart card is tapped on and tapped out -->
  <on-Tap-cardmon action-name="logoff" card-tapon="" LoginAction="loggedin"
TapCardSwitchUser="true"/>
</action-triggers>
</application-runner-script>
```

NOTE: Additional action file examples can be found in SecureLogin\Tools\DAS Editor\Script Samples\XML on the SecureLogin CD image.

23 Support for Tap to Switch User

Traditional single sign-on solutions provide credential management solutions to web and Windows applications. Organizations now require more services that provide flexibility to users as well as ease of deployment and integration with other applications.

Let us assume Digital Health is a hospital that has a centralized nurse station where all the nurses and doctors are required to login and logout for patient administration. Now, Digital Health requires following capabilities from a single sign-on solution tool:

- ◆ Support for the Kiosk mode to avoid multiple systems
- ◆ Multi-user interface to save login/logoff time when users switch
- ◆ An alternative to the conventional username/password method to save time in emergency situations

To overcome these challenges the Tap to Switch User feature of SecureLogin provides following capabilities:

- ◆ Supports the Kiosk mode
- ◆ Integration with Desktop Automation Services (DAS) and Advanced Authentication allows user to switch using smart cards
- ◆ Support for contact-less smart cards

The following sections contain information about how to configure SecureLogin for the Tap to Switch User feature.

- ◆ [Section 23.1, “Prerequisites,” on page 173](#)
- ◆ [Section 23.2, “Configuring the Tap To Switch User Feature,” on page 173](#)

23.1 Prerequisites

This following list includes the minimum requirements to enable the Tap to Switch User feature:

1. SecureLogin 8.1.1 or above.
2. Contact-less smart cards enrolled for the Active Directory users.

23.2 Configuring the Tap To Switch User Feature

Perform the followings steps to configure the Tap to Switch User feature:

- 1 Select the following features while installing SecureLogin:
 - ◆ In the **Select the datastore for SecureLogin** menu, select the **Microsoft Active Directory** option
 - ◆ In the **Custom Setup** menu, select **Advanced Authentication** and **Desktop Automation Services**.

For more information about how to install SecureLogin, see [SecureLogin 9.1 Installation Guide](#).

- 2 Perform the following steps to configure the Kiosk Mode in SecureLogin:
 - 2a Click **Start > Run** to open the **Run** dialog box.
 - 2b Specify `regedit` and click **OK** to open **Registry Editor**.
 - 2c Navigate to the **HKEY_LOCAL_MACHINE > SOFTWARE > Protocom > SecureLogin** key.
 - 2d Right click and click **New > DWORD**.
 - 2e Rename the DWORD to **NSLADAuth**.
 - 2f Edit the **NSLADAuth** value to 1.
- 3 Perform the following steps to configure DAS in SecureLogin:
 - 3a Open the DAS configuration file from the following path:

```
C:\Program Files\NetIQ\SecureLogin\Desktop Automation Services\actions.xml
```
 - 3b Edit the `TapCardSwitchUser` attribute in the configuration file to enable tap to switch user operation.

IMPORTANT: The `TapCardSwitchUser` attribute is used to restrict the card tap to switch users in the KIOSK mode. If this attribute value is set to true, then single card tap is required to switch the user. If this attribute value is set to false, then double card tap is required to switch the user.

The following example shows a sample DAS configuration file with the `TapCardSwitchUser` attribute value set to `true`.

```
<?xml version="1.0"?>

<!DOCTYPE application-runner-script SYSTEM "ARS_1.0.dtd">

<!-- KP Base Windows Action for Active Directory Mode Version: 1.02
-->

<!-- Inactivity Counter is supposed to be working -->

<application-runner-script>

<action name="startup">

<test-app-running application="sltray.exe">

<if-true>

<AD-logout gina="false" />

<!-- delay for NSL to successfully shutdown -->

<pause interval="750" />

<hide-desktop/>

<pause interval="750" />
```

```

<!-- <kill-all-apps exclude-
apps="slproto.exe:slwinsso.exe:slbroker.exe:explorer.exe:notepad.ex
e" /> -->

<pause interval="750" />

<run-application application="sltray.exe" parameters="" on-exit-
action="" serial="true" interval="500"/>

</if-true>

<if-false>

<hide-desktop />

<pause interval="750" />

<run-application application="sltray.exe" parameters="" on-exit-
action="" serial="true" interval="500"/>

</if-false>

</test-app-running>

</action>

<action name="showdesktop">

<unhide-desktop/>

</action>

<action name="SCLogoff">

<AD-logout gina="false" />

<!-- delay for NSL to successfully shutdown -->

<pause interval="750" />

<hide-desktop/>

<pause interval="750" />

<!-- <kill-all-apps exclude-
apps="slproto.exe:slwinsso.exe:slbroker.exe:explorer.exe:notepad.ex
e" /> -->

<pause interval="750" />

<run-application application="sltray.exe" parameters="" on-exit-
action="" serial="true" interval="500"/>

</action>

```

```

<action name="insert">
<test-app-running application="sltray.exe">
<if-true></if-true>
<if-false>
<run-application application="sltray.exe" parameters="" on-exit-
action="" serial="true" interval="500"/>
</if-false>
</test-app-running>
</action>
<action-triggers>
<on-Tap-cardmon action-name="SCLogoff" card-tapon="insert"
LoginAction= "showdesktop" TapCardSwitchUser="true"/>
</action-triggers>
</application-runner-script>

```

For more information about how to configure DAS configuration, see [Chapter 22, “Administering Desktop Automation Services,”](#) on page 149.

- 4 Perform the following steps to configure DAS to start during Windows start up:
 - 4a Click **Start > Run** to open the **Run** dialog box.
 - 4b Specify `regedit` and click **OK** to open **Registry Editor**.
 - 4c Navigate to the **HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Run** key.
 - 4d Right click and click **New > String Value**.
 - 4e Edit **String Value** and specify the DAS executable path in the **Value data** field. For example, specify `DAS : C:\Program Files\NetIQ\SecureLogin\Desktop Automation Services\ARS.exe startup` in the **Value data** field.

NOTE: The `startup` parameter in the DAS executable path is the additional parameter used in DAS to invoke a default action defined in the `actions.xml` DAS configuration file during Windows startup.

- 4f Restart the Windows.

24 LDAP SSL Server Certificate Verification

- ♦ [Section 24.1, “About LDAP SSL Server Certificate Verification,” on page 177](#)
- ♦ [Section 24.2, “Validating an LDAP SSL Server Certificate,” on page 177](#)
- ♦ [Section 24.3, “Enabling LDAP SSL Certificate Verification,” on page 178](#)

24.1 About LDAP SSL Server Certificate Verification

The LDAP SSL server certificate verification is a security feature that was introduced in the SecureLogin 6.0 SP1 release. This feature allows the client to verify the trustworthiness of the server, using a process similar to the certificate verification process carried out by browsers like Microsoft Internet Explorer and Mozilla Firefox.

Certificate verification of the server is important to prevent potential security risks. It is essential that the client verify the server certificate during the LDAP SSL connection to the server. If the client cannot verify the server certificate, it is possible that an intruder on the same subnet can decrypt the communication between the client and access user credentials.

By default, eDirectory is configured for self-signed certificates. Although self-signed certificate works, it does not pass all the validation checks carried out during the verification process. So, users are prompted to validate the certificate at the first time they attempt to access the server. To prevent this, you can obtain a signed certificate from a known certificate authority such as VeriSign and replace the existing certificate.

24.2 Validating an LDAP SSL Server Certificate

During the establishment of an LDAP SSL connection, client receives the root certificate from the server so that the client can verify the trustworthiness of the server. The client uses the following process to validate the certificate:

- ♦ It compares the current certificate with any of the previously stored certificate. If the certificates match, the client does not perform further checks, and adds the certificate to the local store. If the certificates do not match, the client continues the validation process.
- ♦ It checks whether the certificate is trusted. This ensures that a known authority is issuing the certificate.
- ♦ It checks whether the date on the certificate is valid with reference to the current date.
- ♦ It checks whether the host name on the certificate matches the date on the server.

If the certificate passes these preceding tests, the client adds the certificate to local store so it can be used for future verification.

If the certificate does not pass the verification process, the application prompts you to either continue the connection or terminate the connection.

- ♦ To continue the connection, click **Yes**. The certificate is added to the local store so it can be used for future verification, and the authentication process continues.
- ♦ To terminate the connection, click **No**.
- ♦ To get details about the certificate, click **View Certificate** to display the Certificate Information dialog box shown in the proceeding figure. If you decide that the certificate is valid, you can click **Install Certificate** to permanently install the certificate.

NOTE: The Windows workstation local store is different from the SecureLogin LDAPAuth clients certificate store.

24.3 Enabling LDAP SSL Certificate Verification

By default, the certificate verification feature is disabled. You can enable this feature by adding the following registry value:

- 1 On a Windows workstation, click **Start > Run** to display the Run dialog box.
- 2 Type `regedit` then click **OK** to open the Registry Editor.
- 3 Browse to the `HKEY_LOCAL_MACHINE\SOFTWARE\Novell\Login\LDAP` registry hive.
- 4 Create a new **DWORD Value** named `VerifySSLCert` and set it to **1**.
- 5 Exit the Registry Editor.

25 Security Considerations

Consider the following to help ensure security for SecureLogin:

- ♦ Use the AES (Advanced encryption standard) or Triple DES (Data Encryption Standard) for the encryption of SecureLogin data.
- ♦ Back up SecureLogin data and directory data by using encryption and password protection.
- ♦ Use `AAVerify` to provide additional advanced authentication to single sign-on applications with NMAS methods or other AA methods such as NetIQ Advanced Authentication Framework.
- ♦ Implement smart cards, storing application credentials on cards and the encryption of the data store using PKI credentials.
- ♦ Protect the SecureLogin desktop shortcut with a password so that others cannot view SecureLogin data.
- ♦ Prevent certain SecureLogin settings and options from being visible or modifiable by others.
- ♦ Use a universal password for increased security by providing additional layers of policies.
- ♦ Require SecureLDAP when using LDAP to authenticate to SecureLogin.
- ♦ Use Novell SecretStore to provide additional security to SecureLogin data stored on eDirectory.
- ♦ Use AA methods such as OTP and NMAS to provide advanced authentication, such as fingerprint, and token-based authentication.
- ♦ Store SecureLogin credentials in a PIN-protected smart card, which provides a secure, portable, and efficient single sign-on solution.
- ♦ Keep the local cache files in a user profile directory so that only the corresponding Windows user can access them.
- ♦ Enable a passphrase to provide additional security to SecureLogin user data.
- ♦ Ensure strict password policies for SecureLogin users and for all single sign-on logins. Randomization of passwords and hiding them from end users is also essential.
- ♦ Use auditing features such as NetIQ Sentinel, SNMP alerts and Windows event logs to capture SecureLogin activity wherever applicable.
- ♦ When you are using LDAP with NMAS, the SecureLogin universal password must be enabled.

26 SecureLogin Security Role Configuration for Active Directory

For a user to administer SecureLogin in an Active Directory environment, the user must have both sufficient permissions to the SecureLogin attributes and the SecureLogin settings to allow access.

In this Chapter

- ◆ [Directory Attributes](#)
- ◆ [Directory Permissions Assignment](#)
- ◆ [Assigning Permissions for SecureLogin Administrators](#)
- ◆ [Assigning Permissions for SecureLogin Help Desk](#)
- ◆ [Assigning SecureLogin Client Settings for Administrators and Help Desk Groups](#)

26.1 Directory Attributes

The protocom attributes hold user or container data that is used by SecureLogin to provide Single Sign-On functionality. These attributes are named as follows:

protocom-SSO-Auth-Data
protocom-SSO-Entries
protocom-SSO-Entries-Checksum
protocom-SSO-Profile
protocom-SSO-Security-Prefs
protocom-SSO-Security-Prefs-Checksum

The function for each of these attributes is as follows:

protocom-SSO-Auth-Data:

- ◆ This attribute is only for a User object. It is an octet-string type.
- ◆ It contains all user-specific authentication data, such as the passphrase.

protocom-SSO-Entries:

This attribute is for User, Container, and Organizational Unit objects. It is an octet-string type. This attribute contains the following:

- ◆ All the user's login user IDs and passwords
- ◆ Specific preferences and application definitions at the User object
- ◆ Corporate application definitions and preferences at the Container and Organizational Unit objects

protocom-SSO-Entries-Checksum:

- ◆ This attribute optimizes the loading of data from the Directory. Whenever data changes in the protocom-SSO-Entries attributes, the Checksum attribute is updated. When SecureLogin loads, it reads the checksum and compares it to the checksum in memory. If the checksums are different, SecureLogin reloads the Entries attribute from the directory.

NOTE: This attribute is used only when the database mode is set to 6.0 or higher.

protocom-SSO-Profile:

- ◆ This attribute is used to instruct SecureLogin to read the settings and preferences from another container.

protocom-SSO-Security-Prefs:

- ◆ This attribute stores data required for SecureLogin to operate before loading the users datastore. This data can include Administrator-set Passphrase questions, Passphrase help information, settings, and similar things.

protocom-SSO-Security-Prefs-Checksum:

- ◆ This attribute functions with the protocom-SSO-Security-Prefs attribute much like the protocom-SSO-Entries-Checksum functions with the protocom-SSO-Entries attribute.

NOTE: This attribute is used only when the database mode is set to 6.0 or higher.

26.2 Directory Permissions Assignment

Based upon the above attribute descriptions and functions, specific roles might be granted the following permissions:

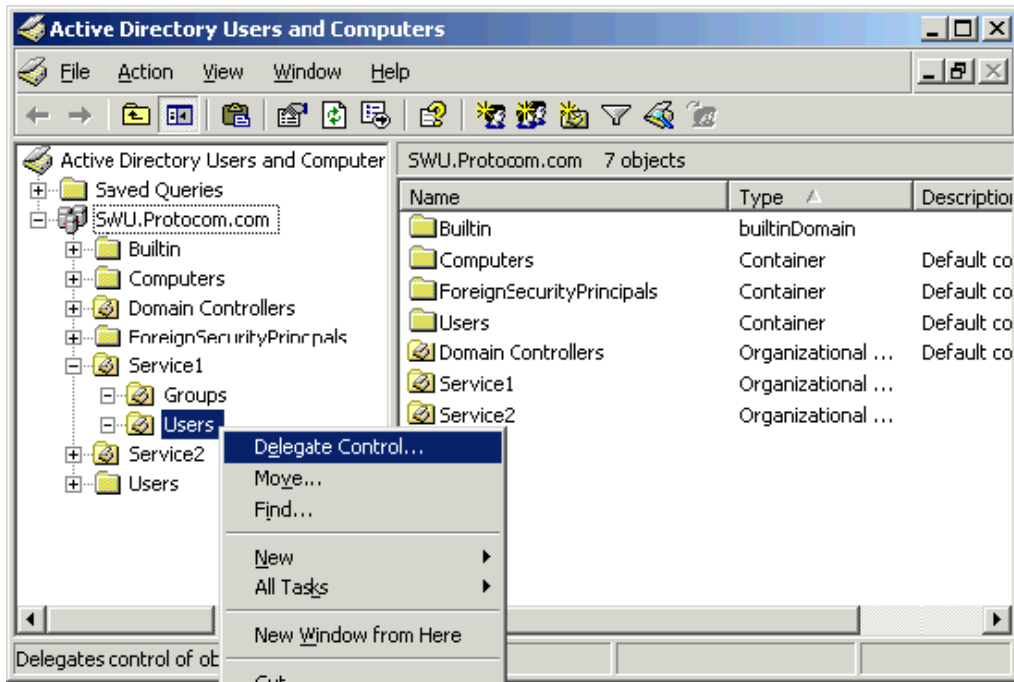

- ◆ Complete SecureLogin Management:
 - ◆ protocom-SSO-Auth-Data = Read and Write
 - ◆ protocom-SSO-Entries = Read and Write
 - ◆ protocom-SSO-Entries-Checksum = Read and Write
 - ◆ protocom-SSO-Security-Prefs = Read and Write
 - ◆ protocom-SSO-Security-Prefs-Checksum = Read and Write
- ◆ Script, Credentials, and Clear Object Data administration:
 - ◆ protocom-SSO-Auth-Data = Read and Write
 - ◆ protocom-SSO-Entries = Read and Write
 - ◆ protocom-SSO-Entries-Checksum = Read and Write

Depending on the needs of your organization, these permissions can be assigned to specific users or groups at an organizational unit level. The following discussion demonstrates the creation of a SecureLogin Administration group and the delegation of permissions to an organizational unit that is one level below the top level organizational units in the Directory hierarchy.

26.3 Assigning Permissions for SecureLogin Administrators

- 1 Login to the Active Directory domain as an administrative level user.
- 2 On a workstation or server, open **Active Directory User and Computers** (dsa.msc), and browse to the OU where you would like to create the group that will manage SecureLogin for the selected container and its children.
- 3 Click the create group button.

- 4 Give the group a descriptive name, such as Service1-SecureLogin-Admins.
- 5 Add the appropriate users to the group.
- 6 Delegate the permissions to the SecureLogin attributes at the container where the users are.

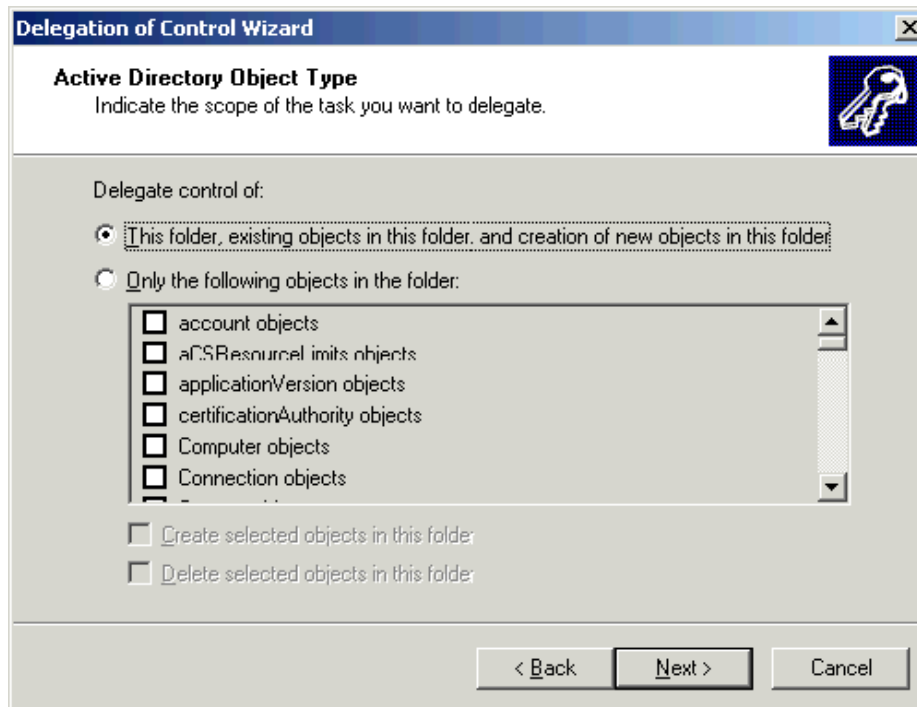

- 7 Add the group you want to delegate control, then click **Next**.

- 8 Select create a custom task to delegate, then click **Next**.

- 9 Select **This folder, existing objects in this folder, and creation of new objects in this folder**, then click **Next**.

- 10 Since these are administrator level users, they will be granted permissions to manage all aspects of the container and its subordinate objects. Select the **General**, **Property-specific** check boxes. Select the **Read**, **Write**, **Read All Properties**, and **Write All Properties** permissions.

Verify that you have all Protocom permissions with **Read** and **Write**. Click **Next** to continue.

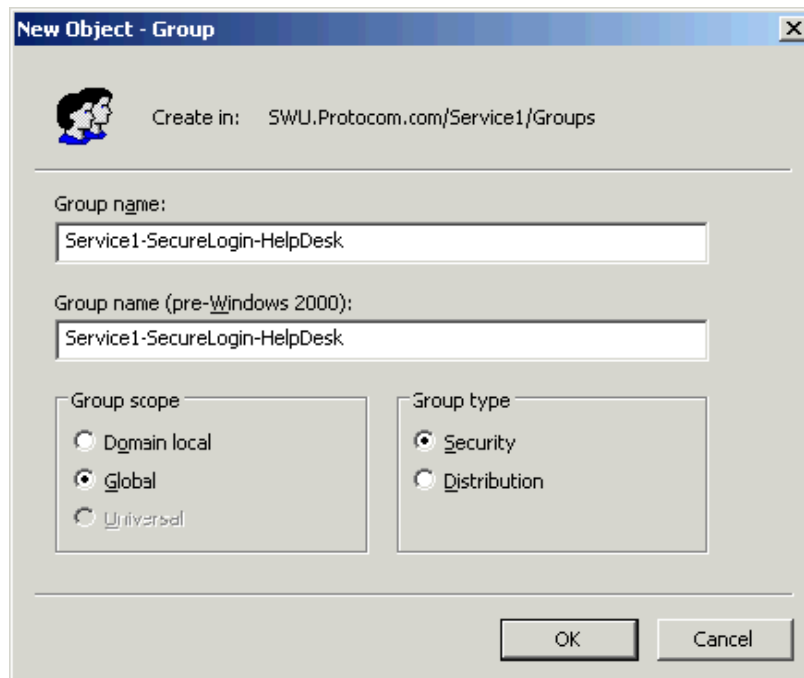

- 11 You are now finished with the delegate control wizard for the Service1-SecureLogin-Admins group. Click **Finish**.

26.4 Assigning Permissions for SecureLogin Help Desk

- 1 Login to the Active Directory domain as an administrative level user.
- 2 On a workstation or server open Active Directory User and Computers, and browse to the OU where you would like to create the group that will hold the Help Desk users who will work with SecureLogin for the selected container and its children.

- 3 Click the create group button.
- 4 Give the group a descriptive name, such as Service1-SecureLogin-Help Desk.

- 5 Add the appropriate users to the group.
- 6 Delegate the permissions to the SecureLogin attributes at the container where the users are.
- 7 Add the group you want to delegate control to, then click **Next**.
- 8 Select create a custom task to delegate, then click **Next**.
- 9 Select the **Only the following objects in the folder**, then scroll down to user objects and select it. Click **Next**.
- 10 Since these are SecureLogin Help desk level users they will only be granted permissions to manage the SecureLogin attributes. Select the General and Property-Specific checkboxes. Then scroll down and select both the read and write permissions for all protocom- attributes.
- 11 You are now finished with the delegate control wizard for the Service1-SecureLogin-Admins group. Click **Finish**.

26.5 Assigning SecureLogin Client Settings for Administrators and Help Desk Groups

Now that you have assigned the correct Directory permissions to allow members of the administrators and help desk groups to read and write the protocom attributes, you need to assign the SecureLogin client settings (SecureLogin preferences) to allow them to see what they have permissions to access. This is required to override the more restrictive settings the user will inherit from their parent container.

To accomplish this, you can either directly modify the users individual settings. A viable approach if you have a few users who will be granted the elevated permissions. This said, many customers still choose the direct assignment approach, as it can reduce the steps when troubleshooting where someone is getting a specific client setting from. Alternatively, you might utilize SecureLogin group policies. In both cases, see step 8 for the recommended settings.

It assumed that you know how to assign individual user's settings, and the information in this section focuses on the use of group policies (assuming the feature was enabled during the product installation). As stated previously, both methods have their merits and should be evaluated before deciding on an approach.

26.5.1 Creating the Group Policy

- 1 Log in to the Active Directory domain as a administrative level user.
- 2 On a workstation or server open Active Directory User and Computers, and browse to the OU that contains the groups that you created earlier. Right click it, select **Properties**.
- 3 In the properties dialog that opens up, select the **Group Policy Tab**.

NOTE: In this example, the Group Policy Management snap-in has been installed. It can be downloaded from [Microsoft \(http://www.microsoft.com/downloads/details.aspx?FamilyID=0a6d4c24-8cbd-4b35-9272-dd3cbfc81887&displaylang=en\)](http://www.microsoft.com/downloads/details.aspx?FamilyID=0a6d4c24-8cbd-4b35-9272-dd3cbfc81887&displaylang=en)

- 4 Click **Open**.
- 5 Select the **Group Policy Objects** container, right-click it, and click **New**.
- 6 Enter a name for the GPO.
- 7 Right-click the new GPO and select **Edit**.
- 8 Go to **User Configuration > Software Settings**. In the right pane, double-click SecureLogin.
- 9 In the SecureLogin management interface, select the **Preferences** tab. Set each setting in accordance with what you want the users to do.

NOTE: The users referred in this example are administrators and help desk staff. They have full access to the SecureLogin client. Your configuration might differ slightly.

The preferences highlighted are the ones that are critical to ensure users are able to manage SecureLogin. Ensure that they are set as follows:

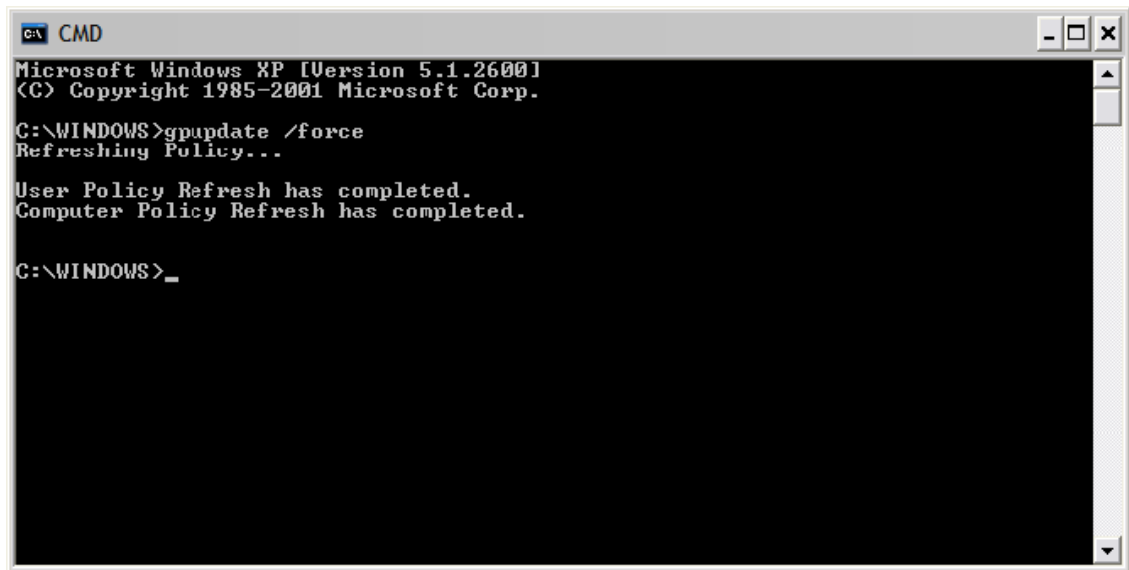

| | | |
|---|-----|----------------|
| Add application prompts for Internet ... | No | <Current GPO . |
| Add application prompts for Java app... | No | Default |
| Add application prompts for Windows... | No | <Current GPO . |
| Allow single sign-on to Internet Explorer | Yes | Default |
| Allow single sign-on to Java applicati... | Yes | Default |
| Allow single sign-on to Netscape | No | <Current GPO . |
| Allow single sign-on to Windows appl... | Yes | Default |
| Allow user to backup/restore | Yes | Default |
| Allow users to modify User ID descrip... | Yes | Default |
| Allow users to view and change Pref... | Yes | Default |
| Allow users to view and modify API p... | No | <Current GPO . |
| Allow users to view and modify Appli... | Yes | Default |
| Allow users to view passwords | No | <Current GPO . |
| Change the cache refresh interval (in... | 60 | <Current GPO . |
| Detect incorrect passwords | No | <Current GPO . |
| Disable single sign-on | No | Default |
| Display the system tray icon | Yes | Default |
| Enable cache file | Yes | Default |
| Enable the New Login Wizard on the... | Yes | Default |
| Enforce passphrase use | Yes | <Current GPO . |
| Password protect the system tray icon | Yes | <Current GPO . |
| Remove advanced settings | No | Default |
| Stop walking here | No | Default |

- 10 Click **OK**. This might take a minute to save.
- 11 Close the GPO editor.
- 12 In the GPM, select the new GPO you created, remove the Authenticated Users group, and add the admin and help desk groups you created in the previous two sections.
- 13 Link this policy to the OU where the users are located. Right-click and select **Link to an existing GPO**.
- 14 Select the GPO you created, click **OK**.
- 15 Close the GPM. Click **OK** on the group policy tab.
- 16 Close Active Directory Users and Computers.

26.5.2 Testing the Configuration

If you chose to use individual assignment or GPO assignment, proceed with the following tests to confirm your updated configuration:

- 1 On a workstation with SecureLogin and the Active Directory Admin Pack, log in as a user who is a member of one of the groups you have configured as SecureLogin administrators or help desk.
- 2 If your GPO refresh has not occurred, you can manually force the update by going to a command line and issuing the `gpupdate /force` command (Windows XP). You should see results similar to the following:

```
c:\ CMD
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\WINDOWS>gpupdate /force
Refreshing Policy...

User Policy Refresh has completed.
Computer Policy Refresh has completed.

C:\WINDOWS>_
```

- 3 Launch Active Directory Users and Computers. Navigate to the container where you delegated control. As a member of the Admins group you should be able to manage the OU's, and subordinate objects, applications and preferences.

As a member of the Help Desk group you should be able to only make changes to the users in the OU. It might appear that as a help desk user you can save changes to the OU, but that is not the case. And if you close the Single Sign-On properties and then open it back up, you will see the changes were not saved.

27 Limiting Concurrent Connections

SecureLogin when installed in the LDAP mode (for eDirectory or non-eDirectory), can restrict the number of concurrent user connections to eDirectory, or Active Directory. According to the limit set for a user at the directory level, SecureLogin decides whether to allow user authentication or deny it. The connection log of all the user accounts is maintained and managed by SecureLogin. The validity of any entry will be decided based on the timestamp and the pre-defined time-to-live parameter.

Setting up the environment for limiting concurrent connections consists of the following actions:

- ♦ [Section 27.1, “Registry Entry,” on page 189](#)
- ♦ [Section 27.2, “Schema Extension,” on page 189](#)
- ♦ [Section 27.3, “Setting the Attribute Values,” on page 191](#)

27.1 Registry Entry

1. Modify the `EnforceConcurrentConnections` value under `HKLM\Software\Novell>Login\LDAP`. This should be a `DWORD` type and the value should be set to `1`. To disable this feature, set the value to `0`.
2. Under `HKLM\SOFTWARE\Novell\Protocom\SecureLogin`, add the value of `LDAPContextlessSearchBindcreds`. Copy this value from the output file that contains the encrypted credential in the string format. For information about encrypting the credentials of the LDAP user, see [Contextless Login](#) in the *SecureLogin 9.1 Installation Guide*.

27.2 Schema Extension

Extend the schema to add the attributes for the limit of concurrent connections and the timestamp for a connection.

For eDirectory: The schema has to be extended and the attribute rights have to be set using the included `.sch` and `.ldif` files, which are found at `SecureLogin\Tools\Schema\LDAP`. The `Concurrent_schema_extn.sch` file is used to add the attributes to the schema, and the `concurrent-rights.ldif` file is used to extend the rights. These files can be extended as mentioned in the preceding options.

The `Concurrent_schema_extn.sch` file can be used to extend the eDirectory schema with one of the following options:

- ♦ **ndssch (eDirectory schema extension utility):** This is a Windows/ Linux executable. Type the following in the command shell:

```
ndssch <AdminDN> Concurrent_schema_extn.sch
```

For more information, see [ndssch Utility](#).

- ♦ **ICE Tool (version 20503.02 or later):** Execute the following command:

```
ice -S SCH -f Concurrent_schema_extn.sch -D LDAP -d <AdminDN> -w  
<password> -L <ServerCertificate>
```

For more information about ICE (NetIQ Import Conversion Export Utility), see [NetIQ Import Conversion Export Utility](#) in the *eDirectory Administration* guide.

The `concurrent-rights.ldif` file can be extended by using one of the following options:

- ♦ **ICE Tool (version 20503.02 or later):** Execute the following command in eDirectory:

```
♦ ice -S LDIF -f concurrent-rights.ldif -D LDAP -d <AdminDN> -w  
<password> -L <ServerCertificate>
```

For more information about ICE (NetIQ Import Conversion Export Utility), see [NetIQ Import Conversion Export Utility](#) in the *eDirectory Administration* guide.

- ♦ **LDAP Modify tool:** Execute the following command in eDirectory:

```
♦ ldapmodify -x -h <host ip address> -p 389 -D cn=admin,o=context -w  
password -f concurrent-rights.ldif
```

NOTE: LDIF and SCH files are not integrated with the `ldapschema.exe` file, but are bundled as separate files in `SecureLogin\Tools\Schema\LDAP`.

For Active Directory: The `ConcurrentSchema.exe` file is used to extend the schema to add the required attributes to the schema. The default location for this file is `SecureLogin\Tools\Schema\AD`. To extend the schema, perform the following:

- 1 Run the `Concurrentschema.exe` file.
- 2 Select **Extend Active Directory Schema**.
- 3 Assign rights to the directory.
To set the attribute values, see [Section 27.3, “Setting the Attribute Values,”](#) on page 191.
- 4 Click **OK**.

After the schema is extended, three new attributes are added to the list of attributes:

- ♦ **Protocom-SSO-Connections:** This attribute stores the connection information, that is the IP address along with the timestamp. This attribute gets added when a user connects for the first instance.
- ♦ **Protocom-SSO-ConnectionLimit:** This attribute stores the configuration parameter, indicating the number of concurrent connections that are allowed for the user.
- ♦ **Protocom-SSO-ConnectionTTL:** This attribute stores the configuration parameter that indicates how long the connection information will be stored.

27.3 Setting the Attribute Values

To set the attribute values by using MMC (Microsoft Management console), assign the `Protocom-SSO-ConnectionLimit` attribute and the `Protocom-SSO-ConnectionTTL` attribute to the user and then set the attribute values.

To set the attribute values, perform the following:

- 1 In **Active Directory Users and Computers**, click **View > Advanced Features**
- 2 In the Users list, right-click the user and click **Properties > Attribute Editor**.
You can set the attribute values, then click **OK**.

Example:

The attributes are set to the following values:

- ♦ `Protocom-SSO-ConcurrentConnectionLimit`: 2
- ♦ `Protocom-SSO-ConcurrentConnectionTTL`: 1440 (in minutes)

When UserA logs in from workstation 1 with IP 1.1.1.1, a new entry is added to the `Protocom-SSO-Connections` attribute in the `IP@timestamp` format, that is, `1.1.1.1@20110621000000` (2011 June 21 00 AM).

Similarly, when UserA logs in from workstation 2 with IP 2.2.2.2, another entry is added to the `Protocom-SSO-Connections` attribute in the `IP@timestamp` format, that is, `2.2.2.2@20110621040000` (2011 June 21 04 AM).

If UserA then tries to log in from workstation 3, SecureLogin will deny the authentication because the connection limit is exceeded.

28 Support for Advanced Authentication

SecureLogin uses the Advanced Authentication infrastructure to integrate SecureLogin features with Advanced Authentication. The integration with Advanced Authentication helps SecureLogin to single sign-on to the required application by using different authentication mechanism. For more information about Advanced Authentication, see the [Server Administration Guide](#).

In a deployment with Advanced Authentication, SecureLogin supports the following features:

- ♦ **Authentication:** Advanced Authentication provides the Credential Provider in the system where it is installed. When the user logs in using this Credential Provider, SecureLogin will also launch seamlessly in an Active Directory environment.
- ♦ **Re-authentication:** SecureLogin leverages this functionality by making Advanced Authentication available during re-authentication. This module can be configured from the wizard or a script. An appropriate authenticator can be selected for re-authentication when configuring this module. This feature is supported in Active Directory, AD LDS and eDirectory environments.
- ♦ **Kiosk Mode:** SecureLogin uses Advanced Authentication as an external authenticator in Active Directory and eDirectory deployments in kiosk mode.
- ♦ **DAS Support:** DAS on Active Directory and eDirectory supports the Advanced Authentication and SecureLogin integrated environment. This feature can effectively be used for desktop sharing using DAS.

In this Chapter

- ♦ [Advanced Authentication Registry Settings](#)
- ♦ [Configuration of Advanced Authentication for SecureLogin](#)

28.1 Advanced Authentication Registry Settings

- ♦ To enable kiosk mode, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|--|---------------|---------------|--|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin | DWORD | NSLADAUTH | For kiosk authentication, set NSLADAUTH to 1. Setting NSLADAUTH to 0 is the default behavior. |

- ♦ To disable advanced authentication, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|--|---------------|---------------|--|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin | DWORD | NoAuthasas | For disabling the advanced authentication feature, set NoAuthasas to 1; but for enabling it, set to 0. |

- ◆ To enable Advanced Authentication debug logging, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|--|---------------|---------------|---|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin\Logging | DWORD | All | For enabling the advanced authentication debug logging, set All to 0. Only log levels 1 and 2 are supported. |

- ◆ To disable SSL check, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|---|---------------|-----------------|---|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin\AdvancedAuthentication | DWORD | DisableSSLCheck | For disabling the SSL check, set DisableSSLCheck to 1; but for enabling it, set to 0 (default). IMPORTANT: If you set the registry value to 0, you must upload the SSL certificate to the Advanced Authentication server. |

- ◆ To change the background image, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|---|---------------|---------------------|--|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin\AdvancedAuthentication | SZ | BackgroundImagePath | Specify the path that contains the background image. |

- ◆ To change the system tray icon, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|---|---------------|---------------|--|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin\AdvancedAuthentication | SZ | IconPath | Specify the path that contains the system tray icon. |

- ♦ To change the windows title, create the following registry:

| Registry Path | Registry Type | Registry Name | Registry Value |
|---|---------------|---------------|---------------------------|
| HKEY_LOCAL_MACHINE \SOFTWARE\Protocom \SecureLogin\AdvancedAuthentication | SZ | WindowTitle | Specify the window title. |

28.2 Configuration of Advanced Authentication for SecureLogin

When installing Advanced Authentication, the default event name is **Windows logon** in the Advanced Authentication server.

You can also enter any custom name (same as configured in the Advanced Authentication server) as the event name, as the custom event can be used for re-authentication and KIOSK mode.

If you enable the Kiosk mode, you need to enter the username and logon method. The logon method will have the list of chains from the custom event or the Windows Logon event. For the re-authentication wizard, the list of chains either from the custom or **Windows Logon** event will be displayed for selection. You must choose a logon method to initiate the Advanced Authentication flow.

NOTE: During SecureLogin installation, the installer registers an endpoint to the Advanced Authentication server, which is used for validation of the credentials for all supported mechanisms.

SecureLogin uses TLS v1.2 to communicate with the Advanced Authentication server. If your deployment does not allow using TLS v1.2, you can use the lower version after performing the following steps:

IMPORTANT: It is not recommended to use TLS 1.1 because it is less secure than TLS 1.2 and it may open your deployment to the security threats.

- 1 Navigate to the SecureLogin installation folder. For example, C:\Program Files\NetIQ\SecureLogin.
- 2 Open the `config.cfg` configuration file.
- 3 Specify the following in the configuration file.
`tlsVersion: TLSv1.1`
- 4 Save the configuration file.

29 VBA Emulators for SecureLogin

VBA emulators support the Visual Basic scripting language. You can write a macro for the emulator. The macro prompts SecureLogin to enter credentials. Configuring VBA emulators to work with Terminal Launcher is a specialized field and is specific to each emulator.

You can configure VBA emulators as generic emulators. However, the generic configuration offers limited functionality.

In this Chapter

- ◆ [Configuring VBA Emulators](#)
- ◆ [Configuring Reflections](#)
- ◆ [Creating a Macro](#)
- ◆ [Configuring the Emulator Type of Terminal Launcher](#)

29.1 Configuring VBA Emulators

Perform the following steps to configure a VBA emulator:

- 1 Click **Start > Programs > NetIQ SecureLogin > Terminal Launcher 32** or **Terminal Launcher 64**. Terminal Launcher displays the applications for which you have created VB scripts.
- 2 Click **Edit Available Emulators > New**.
- 3 Specify a name for the emulator, select VBA as the emulator type, and click **OK**.
- 4 Specify the following details:

| Field | Description |
|------------------------------|---|
| Emulator Path | Specify the path to the emulator. For example, select R8win.exe, which supports IBM PC (Reflection for IBM). |
| Emulator Session File | Specify a name for the valid session file to be created in the .rd3x format. For example, let us connect to an IBM 3270 Terminal by using Trace Player that simulates the session. |

- 5 Click **OK**.
- 6 Click **Done**.
- 7 Continue with [Configuring Reflections](#).

29.2 Configuring Reflections

The following procedure illustrates the steps to configure a reflection for IBM 3270 terminal as an example:

- 1 Launch the Reflection workspace.
- 2 In **Create New Document**, select `3270 terminal` as the session template.
- 3 Click **Create**.
- 4 Specify host name where the terminal is listening to and device name.
- 5 Specify **Terminal /Device type**. In this example, specify `IBM -3278-&M`.
- 6 Keep the default values of other settings.
- 7 Click **OK**.

An untitled session file is created in the `.rd3x` format.

To determine which type of the terminal you are using, perform the following steps:

1. Open the session in Reflection.
 2. Verify the file extension in the session tab to determine which terminal you are using.
- 8 In the Reflection workspace, click **Macro > Reflection Objects > Modules > Module1** (as this is the first module under the same session).
 - 9 Select **Declarations**.
The VB Editor window opens.
 - 10 Create a sample VB script.
 - 11 Click **Tools > References**.
 - 12 Click **Browse** and select `slVBA Type Library`.
 - 13 Continue with [Creating a Macro](#).

29.3 Creating a Macro

Create a macro that gets the text from the screen and displays it in a message box. For information about how to create a macro, see [Create a Macro with the VBA Editor](#).

Continue with [Configuring the Emulator Type of Terminal Launcher](#).

Samples

- ♦ [Printing the Screen Text](#)
- ♦ [Saving the Entire Screen as Text](#)
- ♦ [Opening a Session Dynamically](#)

Printing the Screen Text

The following is a sample VB script of a macro to capture the screen text:

```
Sub CopyTextMacro()  
    'Create a variable to hold the text  
    Dim screenText As String  
  
    'Get text from the screen starting at screen row 1, column 1, and 30 characters  
    long  
        screenText = ThisIbmScreen.GetText(1, 1, 30)  
  
    'Display the text in a message box  
    MsgBox (screenText )  
End Sub
```

The following is a valid response from the Reflection application and the same response is shown in the console of IBM Simulator 3230 by using Trace Player:

Saving the Entire Screen as Text

The following sample gets all text displayed on a screen and saves that to a text file:

```
Private Function IbmScreen_BeforeSendControlKey(ByVal sender As Variant, key As  
Long) As Boolean  
    Dim screenRows As Integer  
    Dim screenColumns As Integer  
    Dim fnum As Integer  
    Dim screenShot As String  
    screenRows = ThisIbmScreen.rows  
    screenColumns = ThisIbmScreen.columns  
  
    'Get all the text on the screen  
    screenShot = ThisIbmScreen.GetTextEx(1, 1, screenRows, screenColumns,  
GetTextArea_Block, _  
    GetTextWrap_Off, GetTextAttr_Any, GetTextFlags_CRLF)  
  
    'Add a line to separate each screen  
    screenShot = screenShot &  
    "....."  
  
    'Open a file and append the screenshot to the file  
    path = ThisIbmTerminal.SessionFilePath & ".log"  
    fnum = FreeFile()  
    Open path For Append As fnum  
    Print #fnum, screenShot  
    Close #fnum  
  
    IbmScreen_BeforeSendControlKey = True  
End Function
```

For information about how to run this script in Visual Basic Editor, see [Save Screens as Text](#).

Opening a Session Dynamically

You can open or close sessions dynamically. For information about how to open a terminal session from another session that is running in the Reflection workspace, see [Dynamically Open a Session](#).

Save the session and create a working SecureLogin script for the Terminal Emulator type that prints MessageBox to evaluate the interactions of Terminal Launcher. If launched from Terminal Launcher 32, launch the same.

29.4 Configuring the Emulator Type of Terminal Launcher

To interact the screens and inject username and passwords, the VBA Emulator type of the Terminal Launcher must be WinHLLAPI.

Perform the following steps to set WinHLLAPI as the emulator type:

- 1 Click **Start > Programs > NetIQ SecureLogin > Terminal Launcher 32** or **Terminal Launcher 64**.
- 2 Right-click **Terminal Launcher 32** or **Terminal Launcher 64** and select **Run as administrator**.
- 3 Select the application for which you want to change the emulator type.
- 4 Click **Edit Available Emulators**.
- 5 Click **New** and specify the following details:

| Field | Description |
|---------------|----------------------------------|
| Emulator name | Specify a name for the emulator. |
| Emulator type | Select WinHLLAPI. |

- 6 Click **OK**.
- 7 Specify the following details:

| Field | Description |
|-----------------|---|
| Emulator Path | Specify the emulator executable's location. For example, C:\Users\administrator\Desktop\ <session-name>.rd3x< td=""></session-name>.rd3x<> |
| Home Directory | Specify the emulator's home directory. For example, C:\Program Files (x86)\Micro Focus\Reflection |
| HLLAPI DLL | Specify the file name and path. For example, C:\Program Files (x86)\Micro Focus\Reflection\Whlapi32.dll |
| HLLAPI Function | Specify WinHLLAPI. |
| Session Files | Select the current session file. |

- 8 Click **OK > Done**.

30 Troubleshooting

- ◆ [Unable to See Password Using ?syspassword If the User Is Authenticated Using Smart Card PIN](#)
- ◆ [SecureLogin Fails To Provide Single Sign-on to Virtual Applications](#)
- ◆ [SecureLogin Fails To Start For Domain Users On Windows Domains Or Domain Controller Servers](#)
- ◆ [Recovering a Forgotten Password](#)

30.1 Unable to See Password Using ?syspassword If the User Is Authenticated Using Smart Card PIN

Workaround 1: In **Universal Password > Configuration Options**, select **Allow admin to retrieve passwords**.

Workaround 2: In **Universal Password > Configuration Options**, select **Allow the following to retrieve passwords**. Specify the FDN of the user allowed to retrieve the password.

30.2 SecureLogin Fails To Provide Single Sign-on to Virtual Applications

Issue: SecureLogin does not provide SSO to virtual applications because the virtualization tools do not allow SecureLogin running on the host to access the virtualized application.

For example, when you use ZENworks Application Virtualization to virtualize Internet Explorer, SecureLogin does not provide SSO to Internet Explorer. The following reasons can cause this issue:

1. ZENworks Application Virtualization does not allow Internet Explorer to access the existing Internet Explorer registries for the extensions that are configured with SecureLogin.
2. ZENworks Application Virtualization does not allow reading of the COM entries for SecureLogin
3. ZENworks Application Virtualization does not allow reading of the file system where SecureLogin is installed.

Workaround: While virtualizing an application, the virtualization tool must include the registries or the file system sections of the application that SecureLogin will access to provide single sign-on.

For example, if you virtualize Internet Explorer, you must virtualize BHO registry keys also. It will allow SecureLogin to provide single sign-on to Internet Explorer.

30.3 SecureLogin Fails To Start For Domain Users On Windows Domains Or Domain Controller Servers

Issue: When domain users that are not assigned with administrator rights starts SecureLogin, SecureLogin displays the A password change has been detected. For security reasons, it is necessary to logout of windows and log back in. error message and stops working. This issue occurs on Windows Domains or Domain Controller servers. This issue does not occur on Windows clients.

Workaround: Perform the following steps to fix this issue on a Domain Controller server:

- 1 Open the **Group Policy Management** console and navigate to **Domain Controllers**.
- 2 Right-click the appropriate Domain Controller Policy and click **Edit**.
- 3 In the **Group Policy Management Editor** window, click **Computer Configuration**.
- 4 Go to **Policies > Windows Settings > Security Settings > Local Policies > User Rights Assignment**.
- 5 Click **Allow log on locally**.
- 6 Click **Add User or Group** to add the appropriate users or group.
- 7 Click **OK**.

30.4 Recovering a Forgotten Password

The Client Login Extension provides password recovery support for applications that are accessed through SecureLogin. The password recovery support is available for graphical authentication interfaces such as GINA/Credential Provider for LDAP clients, Novell Client, and Microsoft clients. Clients in the Windows operating systems support Credential Provider model of graphical authentication interface. Clients in other operating systems support GINA/Credential Provider model of graphical authentication interface.

NOTE: To enable the Client Login Extension support for Novell Client in a SecureLogin setup, install Novell Client before installing Client Login Extension.

The password recovery support through Client Login Extension is also available for locked workstations and for workstations in which user operations are controlled by Desktop Automation Services.

To know more about using Client Login Extension tool for recovering forgotten passwords, see the [Client Login Extension Guide](#).

31 Feature Use Cases

- ♦ [Section 31.1, “AutoPass License Server Use Case,” on page 203](#)

31.1 AutoPass License Server Use Case

Mark, an administrator with Reltic Data Inc. recently placed an order for 10000 paper-based licenses of NetIQ SecureLogin to enhance the single sign-on for employees. Currently, the organization is restructuring and it has led to employee provisioning and de-provisioning. This scenario has led to a challenge for Mark and his associates to track the licenses for any of the following tasks:

- ♦ Active SecureLogin user count: Number of SecureLogin users in the organization
- ♦ Centralized license management: Manage SecureLogin license in the web portal
- ♦ Actual SecureLogin usage reporting: Increase or decrease licenses based on usage
- ♦ Email notification: License expiry email notification

Mark and his associates are relying on different methods to keep a track of all the licenses, and it is a challenging task to keep tabs on the licenses and record updated data.

31.1.1 Solution

NetIQ SecureLogin is providing integration with AutoPass License Server (APLS), a Micro Focus web-based solution for managing your Micro Focus Software product licenses. It helps you organize and manage your product licenses, server users, and client users. Following are the benefits of this integration:

- ♦ Centralized Management of SecureLogin license
- ♦ Usage Tracking and Report: Track the current SecureLogin licenses in use, as well as the usage history for APLS administrator to get a quick trend report on the product usage.
- ♦ License Reservation and Blocking: Reserve SecureLogin license capacity for groups or clients
- ♦ Centrally manage license, product, and custom usage
- ♦ Generate usage reports to manage pay-per-use billing

How does this solution benefit Mark?

Mark gets the following benefits with the current solution:

- ♦ Track and monitor the number of users using SecureLogin
- ♦ Get an actual number of SecureLogin instances in the organization
- ♦ Be compliant with the license usage based on the reporting option
- ♦ Receive license expiry email notification

In addition to these benefits, he can take the following decisions:

- ♦ If his organization has purchased licenses higher than the regular usage required, he can work with the Micro Focus team to reduce the capacity and save cost
- ♦ If the maximum license count is reached, a request for more licenses can be placed. It is an opportunity to fix up the gap.

More than 120 products of Micro Focus are using AutoPass license technology. 26 products have integrated with AutoPass License Server for managing the license centrally. More teams are planning to integrate.

A Error Messages

SecureLogin error messages display a number code that generally includes a text description of the error. SecureLogin error numbers currently range between -101 and -914. Following is a list of these error message, their cause, and the appropriate action to take.

Some of the codes displayed in SecureLogin error messages are not native SecureLogin codes. Refer to the relevant application's Help for assistance with the following:

NetIQ eDirectory: Numbers between -1 and -813

Microsoft Active Directory; Error codes such as, 0x80070002

For more information about Active Directory error codes, go to the [Microsoft website](#).

-102: BROKER_NO_SUCH_ENTRY

Possible Cause: You tried to load an application definition or variable that does not exist.

For example, you set up Terminal Launcher to run from a shortcut or to run a particular application definition, but the application definition does not exist.

Action: Check that the name of the application definition is actually defined in SecureLogin. Verify that the name is the same as the name specified in the application definition.

-103: BROKER_INVALID_CLASS_CREATED

Possible Cause: Data has become corrupted, or you are running an earlier version.

SecureLogin is trying to create a new version of the application definition data format that was stored in ANDS.

Action: Upgrade the older SecureLogin client to the new client. Install the latest SecureLogin software.

-104: BROKER_CREATE_CLASS_FAILED

Possible Cause: The SecureLogin client has run out of memory.

Action: Free up some memory. Try again later.

-105: BROKER_REMOVE_ENTRY_FAILED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-106: BROKER_UPDATE_GET_ENTRY_FAILED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-107: BROKER_ENTRY_NOT_FOUND

Possible Cause: An attempt to load an application definition or variable that does not exist.

Action: Check that the name of the application definition is actually defined in SecureLogin. Verify that the name is the same as the name specified in the application definition editor.

-109: BROKER_SCRIPT_BUFFER_ALLOC_FAILED

Possible Cause: The SecureLogin client has run out of memory.

Action: Free up some memory. Try again later.

-110: BROKER_NO_MORE_PLATFORMS

Possible Cause: Data is corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-111: BROKER_NO_MORE_VARIABLES

Possible Cause: Data is corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-112: BROKER_NO_SUCH_VARIABLE

Possible Cause: You are trying to use an undefined variable.

Because SecureLogin is not prompting you for the variable, data has become corrupted, or some other situation is preventing the software from working as expected.

Action: Contact NetIQ Support.

-114: BROKER_PRIMARY_NOT_AVAILABLE

Possible Cause: You are not logged on to the directory. You are using the offline cache. Therefore, you cannot perform some directory functions. For example, you cannot change your passphrase.

Action: Log in to the directory.

-116: BROKER_HEADER_DATA_CORRUPT

Possible Cause: Data is corrupted. You might have a customized build for your site, but have installed a standard version of SecureLogin, or have gone from a standard version to a customized build for your site.

Action: Delete the local cache file and try again. If unsuccessful, contact NetIQ Support.

-120: BROKER_INVALID_PREF_DATA_TYPE

Possible Cause: Data is corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-121: BROKER_PREFERENCE_DATA_CORRUPT

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-122: BROKER_TARGET_ENTRY_LIST_NOT_LOADED

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-123: BROKER_CACHE_PASSWORD_INCORRECT

Possible Cause: You have tried to log on from offline mode, but the password you entered does not match the expected password from the local cache.

Typically, the offline password is the passphrase answer.

Action: Enter the correct passphrase answer or directory password.

-129: BROKER_ENTRY_LIST_NOT_NULL

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Delete the local cache file and try again. If unsuccessful, contact NetIQ Support.

-130: BROKER_ENTRY_LIST_NULL

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Delete the local cache file and try again. If unsuccessful, contact NetIQ Support.

-131: BROKER_YSM_LIST_NOT_NULL

Possible Cause: Memory is not handled as expected.

Action: Contact NetIQ Support.

-132: BROKER_SYM_LIST_NULL

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-138: BROKER_SYMBOL_DATA_CORRUPT

Possible Cause: Data has become corrupted in the local cache file or in the directory.

Action: Delete the local cache file and try again. If unsuccessful, contact NetIQ Support.

-140: BROKER_SCRIPT_DATA_CORRUPT

Possible Cause: Data has become corrupted in application definitions.

Action: Delete the local cache file and try again.

-141: BROKER_PREF_INVALID

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-142: BROKER_SET_PREF_INVALID

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-145: BROKER_SECURITY_ALERT

Possible Cause: Unable to locate security keys (AuthData), but security data appears to exist. It is possible that someone has attempted to gain access to your security data.

Action: Contact your system administrator.

-166: BROKER_INVALID_DES_KEY

Possible Cause: Hex strings are invalid. The DES_KEY variable requires hexadecimal (0-9, A-F) numbers.

Action: Make sure that the DES_KEY variable contains only hexadecimal numbers.

-167: BROKER_INVALID_DES_OFFSET

Possible Cause: Hex strings are invalid. The DES_OFFSET variable requires hexadecimal (0-9, A-F) numbers.

Action: Make sure the DES_OFFSET variable contains only hexadecimal numbers.

-168: BROKER_DESKEY_NOT_FOUND

Possible Cause: You tried to generate a one-time password for a platform. However, you have not defined the DES_KEY variable.

Action: Create the DES_KEY variable.

-169: BROKER_DESOFFSET_NOT_FOUND

Possible Cause: You tried to generate a one-time password for a platform. However, you have not defined the DES_OFFSET variable.

Action: Create the DES_OFFSET variable.

-171: BROKER_CACHE_FILE_OPEN_FAIL

Possible Cause: SecureLogin tried to read or write to the offline cache. However, SecureLogin is unable to open the cache file.

Action: Assign rights so that the specified user object has rights to the cache directory.

-173: BROKER_NO_MORE_CACHE_FILE_DATA

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-174: BROKER_CACHE_SAVE_FAILED

Possible Cause: SecureLogin is unable to save data to the offline cache.

Action: Assign rights so that the specified user object has rights to the cache directory.

-175: BROKER_CACHE_SECRETS_INCORRECT

Possible Cause: The offline cache password is incorrect for either of the following reasons:

- ◆ The key used to decrypt the cache file is not the key that the cache file was encrypted with.
- ◆ If you log on as a user to a workstation and create a cache file, and then you go to another workstation, reset your passphrase and log on, then when you return to the original workstation this error message appears.

Action: Delete the cache file.

-176: BROKER_PUBLIC_KEY_READ_FAILED

Possible Cause: SecureLogin is unable to read the public key from Active Directory System.

Action: Troubleshoot Microsoft Active Directory System and Microsoft ADAM.

-177: BROKER_PUBLIC_KEY_HAS_CHANGED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-179: BROKER_RTVALUE_DOES_NOT_EXIST

Possible Cause: You tried to read a runtime variable that is not defined.

Action: Check the application definition. Make sure that the variable is set before it is read or used as a command.

-180: BROKER_DS_VARIABLE_NOT_READ

Possible Cause: You used one of the % variables to read a directory attribute, but SecureLogin cannot read the variable.

Action: Make sure that you have spelled the attribute name correctly. Troubleshoot Microsoft Active Directory System or Microsoft ADAM.

-181: BROKER_WRONG_PASS_PHRASE

Possible Cause: The passphrase or password is incorrect. The reason could be:

- ◆ You entered the wrong passphrase.
- ◆ You tried to change your passphrase, but entered it incorrectly.
- ◆ You password protected the SecureLogin notification area (system tray) icon and entered the incorrect password.

Action: Enter the passphrase or password correctly.

-190: BROKER_NO_AUTH_DATA_FOUND

Possible Cause: Although the SecureLogin Entry attribute has data, the SecureLogin Auth attribute was blank.

Someone deleted the SecureLogin Auth attribute.

Action: Delete the Prot:SSO Entry attribute.

SecureLogin creates these attributes the next time you run SecureLogin.

-192: BROKER_UNABLE_TO_INSTANTIATE

Possible Cause: A module, for example, WinSSO, is unable to connect to the Combroker.

Action: If you are using Windows 95, make sure that you have the latest DCOM update, or reinstall Internet Explorer.

For other platforms, reinstall SecureLogin.

-195: BROKER_FILE_TRAITS_OP_NOT_IMPLEMENTED

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-196: BROKER_DUMMY_OP_NOT_IMPLEMENTED

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-199: BROKER_ERROR_COMMAND_NOT_HANDLED

Possible Cause: An application definition parser encountered an unrecognizable command.

Action: Make sure that:

- ♦ The command is spelled correctly.
- ♦ The If/EndIf blocks match.

-200: BROKER_END_OF_SCRIPT

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-201: BROKER_UNEXPECTED_END_OF_SCRIPT

Possible Cause: `If/EndIf` or `Repeat/EndRepeat` blocks do not match. SecureLogin reached the end of the application definition without finding an expected `EndIf` or `EndRepeat` command.

Action: Check the application definition. Make sure that the `If/EndIf` and `Repeat/EndRepeat` blocks match.

-206: BROKER_BREAK_BLOCK

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-207: BROKER_END_SCRIPT_NOW

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-210: BROKER_CORPORATE_MOD_ABORTED

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-211: BROKER_ENTRY_ALREADY_ON_LIST

Possible Cause: You tried to add an application definition or variable, but an application definition or variable with that name already exists.

Action: Do one of the following

- ♦ Use a different name for the application definition or variable.
- ♦ Rename the existing application definition or variable in the application definition editor.

-213: BROKER_NDS_OP_NOT_IMPLEMENTED

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-214: BROKER_UNABLE_TO_GET_CURRENT_OU

Possible Cause: Data has become corrupted or the software is not working as intended.

Action: Contact NetIQ Support.

-217: BROKER_ARG_NUM

Possible Cause: In application definition language, each command expects a certain number of arguments. You have used either too few or too many arguments for a given command.

Action: Make sure you are passing the correct number of arguments to the command.

-219: BROKER_NOT_A_NUMBER

Possible Cause: The application definition language was expecting a decimal number, but characters other than 0-9 appeared.

Action: Remove incorrect characters.

-220: BROKER_HLLAPI_FUNCTION_NOT_FOUND

Possible Cause: In the Terminal Launcher configuration, you specified a `HLLAPI.DLL` and the name of the function in the DLL. The name of the function cannot be found in the DLL.

Action: Check you have specified the correct terminal emulator type. Make sure that you entered the HLLAPI function correctly.

-221: BROKER_HLLAPI_OBJECT_UNINITIALISED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-222: BROKER_HLLAPI_DLL_LOAD_FAILED

Possible Cause: Terminal Launcher was unable to load the `HLLAPI.DLL` that you specified. The `HLLAPI.DLL` for that emulator is looking for other DLL files that do not exist or are not installed for that emulator.

Action: Make sure that the path and file that you are entered for the DLL are correct.
Check the vendor's documentation for information about that emulator.

-223: BROKER_HLLAPI_OBJECT_ALREADY_INITIALISED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-224: BROKER_ERROR_DURING_WINHLLAPICLEANUP

Possible Cause: Terminal Launcher has called the WinHLLAPI cleanup function for a WinHLLAPI emulator.

Action: Check the vendor's documentation for information about that emulator.

-225: BROKER_CANNOT_FIND_WINHLLAPISTARTUP_FUNCTION_IN_DLL

Possible Cause: In the Terminal Launcher configuration, you incorrectly specified that the emulator is a WinHLLAPI emulator.

Action: Make sure that you have specified the correct emulator type.

-226: BROKER_ERROR_DURING_WINHLLAPISTARTUP

Possible Causes: The reason can be the following:

- ♦ The terminal emulator does not support the right version of HLLAPI (requires at least V.1.1).
- ♦ The attempt to reset a connection to a HLLAPI terminal emulator failed.

Action: Check the vendor's documentation for information about that emulator.

-227: BROKER_CANNOT_FINDWINHLLAPICLEANUP_FUNCTION_IN_DLL

Possible Cause: In the Terminal Launcher configuration, you incorrectly specified that the emulator is a WinHLLAPI emulator.

Action: Make sure you have specified the correct emulator type.

See the NetIQ Web site for information about configuring specific terminal emulators.

-228: BROKER_BUTTON_NOT_FOUND

Possible Cause: For a Windows single sign-on application, no button exists for the control ID you specified. For example, if you specified Click #3, no button exists for control ID #3.

Action: Specify the correct emulator type.

-230: BROKER_SETPLAT_FAILED

Possible Cause: The regular expression that you supplied in the SetPlat command is invalid.

Action: Check the syntax of the regular expression that you provided.

-231: BROKER_AUTH_CANCEL

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-232: BROKER_UNABLE_TO_START_PROGRAM

Possible Cause: The Run command was unable to find and start the requested program.

Action: Make sure that the executable program exists and that the path is correct.

-234: BROKER_FREE_PLATFORM_SCRIPT_NULL_PTR

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-235: BROKER_VBA_LOGIN_INTERFACE_NOT_IMPLEMENTED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-236: BROKER_CHANGEPASSWORD_INVALID_VARIABLE_SYNTAX

Possible Cause: One of the parameters that you pass to the ChangePassword command must be a variable. The parameter that you provided is not a variable.

Action: Specify a variable.

-237: BROKER_MAD_COMMAND_SET_INVALID_VARIABLE_SYNTAX

Possible Cause: The first parameter that you pass to the Set command must be a variable. The parameter that you provided is not a variable.

Action: Specify a variable.

-239: BROKER_POLICY_SCRIPT_ARG_NUM

Possible Cause: One of the commands in a password policy script has too few or too many arguments.

Action: Include the correct number of arguments.

-240: BROKER_VALID_CHARS_OUTNUMBERED

Possible Cause: A password is unable to satisfy a password policy. This is because the maximum number of allowable characters is less than the minimum number of allowable characters.

Action: Set the maximum number of a particular class of characters to a greater number than the minimum number of specified allowable characters.

-241: BROKER_PASSWORD_LOGIC_ERROR

Possible Cause: You have incorrectly set up a password policy. No password can satisfy all the settings.

Action: Work through each restriction in the password policy, and make sure that one restriction does not contradict another restriction in the policy.

-242: BROKER_EXCEPTION_CHARACTER_FOUND

Possible Cause: You entered a password that contains a character that is not allowed.

Action: Use allowable characters in your password.

-243: BROKER_PASSWORD_TOO_SHORT

Possible Cause: You entered a password that does not have enough characters.

Action: Provide enough characters in your password.

-244: BROKER_PASSWORD_TOO_LONG

Possible Cause: You entered a password that has too many characters.

Action: Enter the correct number of characters.

-245: BROKER_INSUFFICIENT_UPPERCASE_CHARS

Possible Cause: You entered a password that has too few uppercase characters.

Action: Use the specified number of uppercase characters in your password.

-246: BROKER_TOO_MANY_UPPERCASE_CHARS

Possible Cause: You entered a password that has too many uppercase characters.

Action: Use the specified number of uppercase characters in your password.

-247: BROKER_INSUFFICIENT_LOWERCASE_CHARS

Possible Cause: You entered a password that has too few lowercase characters.

Action: Use the specified number of lowercase characters in your password.

-248: BROKER_TOO_MANY_LOWERCASE_CHARS

Possible Cause: You entered a password that has too many lowercase characters.

Action: Use the specified number of lowercase characters in your password.

-249: BROKER_INSUFFICIENT_PUNCTUATION_CHARS

Possible Cause: You entered a password that has too few punctuation characters.

Action: Use the specified number of punctuation characters in your password.

-250: BROKER_TOO_MANY_PUNCTUATION_CHARS

Possible Cause: You entered a password that has too many punctuation characters.

Action: Use the specified number of punctuation characters in your password.

-251: BROKER_INSUFFICIENT_NUMERALS

Possible Cause: You entered a password that has too few numerals.

Action: Use the specified number of numerals in your password.

-252: BROKER_TOO_MANY_NUMERALS

Possible Cause: You entered a password that has too many numerals.

Action: Use the specified number of numerals in your password.

-253: BROKER_NT_FILE_TRAITS_OP_NOT_IMPLEMENTED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-256: BROKER_UNABLE_TO_GET_NT_CHACE_DIR

Possible Cause: You are using Windows NT 4 Domains mode, but you have not defined or mapped a Home drive.

Action: Log in as the user to determine whether the Home drive and Home path variables are set. If the variables are not set, use the Windows NT domain administrative tools to set them.

NOTE: Version 3.6 and above do not support Windows NT.

-257: BROKER_UNABLE_TO_CREATE_NT_CACHE_DIR

Possible Cause: The user object did not have rights to create a directory on the user's local drive.

Action: Grant the user object rights to the directory.

-259: BROKER_MUST_BEGIN_WITH_UPPERCASE

Possible Cause: You entered a password that did not begin with an uppercase character.

Action: Enter an uppercase character at the beginning of the password.

-260: BROKER_NO_DATA_STORES_LOADED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-261: BROKER_ENTRY_SRC_OBJECT_MISMATCH

Possible Cause: You are using a platform other than NDS or eDirectory and have moved an object. The directory object that you are reading entries from is not the directory object that the entries were saved to.

Action: Manually copy and paste the scripts between the objects.

-262: BROKER_CACHE_FILE_INCORRECT_VERSION

Possible Cause: The cache file that you are trying to load was created by a later version of SecureLogin.

Action: Use the version of SecureLogin that created the cache file.

Install the latest version of SecureLogin.

-263: BROKER_DDE_LOGIN_INTERFACE_NOT_IMPLEMENTED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-264: BROKER_DDE_CONNECT_FAILED

Possible Cause: Terminal Launcher could not connect to a specified DDE emulator.

Action: Make sure that the emulator launched correctly and the emulator's DDE support is turned on.

-265: BROKER_DDE_DISCONNECT_FAILED

Possible Cause: Failed attempt to disconnect from a DDE-supporting terminal emulator.

Action: See the vendor's documentation.

-266: BROKER_NT_FILE__SAVE_FAILED

Possible Cause: The user object was unable to save to the equivalent of a cache file in the Home directory using Windows NT 4 Domains.

Action: Grant the user object rights so that the user can write files to the Home directory.

NOTE: Version 3.6 and above do not support Windows NT.

-269: BROKER_NOT_A_PASSWORD_POLICY_COMMAND

Possible Cause: An invalid command was used in a password policy.

Action: Make sure that the command is spelled correctly.

-271: BROKER_PASSWORD_UNACCEPTABLE

Possible Cause: The password did not meet the requirements as specified in password policies.

Action: Enter the password correctly.

-273: BROKER_MSTELNET_OPERATION_NOT_SUPPORTED

Possible Cause: The generic emulator cannot support a particular operation, for example, SetCursor.

Action: Do not use the command for generic emulators.

-279: BROKER_EMULATOR_LAUNCH_FAILED

Possible Cause: In Terminal Launcher, you can configure the path to the executable that will run. However, the specified executable is unable to run.

Action: Make sure the path to the emulator is correct.

-280: BROKER_UNABLE_TO_CREATE_EMULATOR

Possible Cause: You have specified an invalid terminal type in TLAUNCH.INI (or the Terminal Launcher configuration).

Action: Specify the correct terminal type.

-281: BROKER_INVALID_CHARACTER_FOUND_IN_PASTE_ID_LIST

Possible Cause: A comma does not separate decimal numbers for copy IDs.

Action: For generic emulators, you must specify a set of copy control IDs. Use a comma to separate decimal numbers.

-282: BROKER_INVALID_CHARACTER_FOUND_IN_COPY_ID_LIST

Possible Cause: A comma does not separate decimal numbers for copy IDs.

Action: For generic emulators, you must specify a set of copy control IDs. Use a comma to separate decimal numbers.

-283: BROKER_UNABLE_TO_READ_TLAUNCH_INI

Possible Cause: SecureLogin is unable to read the TLAUNCH.INI file because the file has been deleted.

Action: Do one of the following:

- ◆ Create a blank `TLAUNCH.INI` file.
- ◆ Return to the default `TLAUNCH.INI` file by reinstalling SecureLogin.

-284: BROKER_NO_TERMINAL_TYPE_DEFINED

Possible Cause: The `TLAUNCH.INI` file contains an error. The terminal type for the emulator is not defined.

Action: Use Terminal Launcher to specify a terminal type for the emulator.

-285: BROKER_EMULATOR_INFO_NOT_FOUND

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-286: BROKER_RELOAD_NOT_ENABLED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-287: BROKER_TERMINAL-CONNECT-TRY-AGAIN

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-289: BROKER_WRONG_OBJECT_TYPE

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-290: BROKER_FILE_LOAD_FAILED

Possible Cause: You do not have enough rights to convert an earlier `TLAUNCH.INI` file to a later format.

Action: Do one of the following:

- ◆ Read an earlier `TLAUNCH.INI` file.
- ◆ Create a new `TLAUNCH.INI` file.

NOTE: Ask the administrator to assign you necessary rights.

-292: BROKER_DLL_NOT_INITIALISED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-294: BROKER_SETPLAT_VARIABLE_MUST_BE_RUN_TIME

Possible Cause: The first argument to a `SetPlat` argument can be a variable. The variable used is not a runtime variable.

Action: Make the first argument a runtime variable.

-295: BROKER_ERROR_CONDITIONAL_COMMAND_NOT_HANDLED

Possible Cause: `SecureLogin` does not handle text in the second part of an `If` command.

Action: Make sure that the command is the one listed and documented correctly.

-297: BROKER_PARSER_ELSE_STATEMENT_FOUND

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-298: BROKER_RAW_MODE_MUST_BE_SECOND_ARG

Possible Cause: For the `Click` command, you have placed the `-X` and `-Y` arguments before `-Raw`.

Action: If you use `-Raw`, place it as the first argument.

-299: BROKER_DISALLOWED_REPEATS_EXIT

Possible Cause: You have tried to use repeated characters in a Password Policy that does not allow them.

Action: Avoid repeated characters.

-300: BROKER_DISALLOWED_SEQUENTIALS_EXIST

Possible Cause: You have tried to use sequential characters in a password, but a Password policy does not allow them.

Action: Avoid sequential characters.

-301: BROKER_DISALLOWED_KEYBOARD_ADJACENTS_EXIST

Possible Cause: You entered a password that has an unacceptable sequence of characters.

Action: Enter an approved sequence of characters.

-303: BROKER_CHARACTER-NOT-IN-REQUIRED-POSITION

Possible Cause: You entered a password that does not have a character in a required position.

Action: Enter the password correctly.

-308: BROKER_BAD_POSITION_ARGUMENT

Possible Cause: While calling a SetCursor command, you tried to move the cursor to an invalid position. For example, out of the terminal session's boundary.

Action: Specify a valid position.

-309: BROKER_ERROR_CONVERTING_POSITION

Possible Cause: The conversion from -X and -Y coordinates for the SetCursor command has failed.

Action: Specify the -X and -Y coordinates for one offset from the top left-hand corner of the screen.

-310: BROKER_NOT_A_WRITABLE_VARIABLE

Possible Cause: You tried to save a new value to a type of variable that cannot be written to.

Action: Use a runtime or normal variable.

-311: BROKER_RUN_SCRIPT_AGAIN

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-312: BROKER_NO_OU_PERIOD_FOUND

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-314: BROKER_COPY_BACKUP_FAILED

Possible Cause: When SecureLogin begins to update the cache file, SecureLogin first copies the current cache file to a file with the same name, but uses the extension `.GOOD`.

SecureLogin was unable to copy the file. The `.GOOD` file is already open because another process is using it.

Possible Cause: You do not have rights to create files in the directory.

Action: Ask the administrator to assign you rights to the directory.

-315: BROKER_GOTO_LABEL_ALREADY_DEFINED

Possible Cause: You have used a `GoTo` command, but the label that you directed it to has already been used.

Action: Remove the second label command.

-316: BROKER_GOTO_LABEL_NOT_DEFINED

Possible Cause: You have used a `GoTo` command, but the label that you directed it to has not been defined.

Action: Define the label.

-317: BROKER_INCORRECT_DATABASE_VERSION

Possible Cause: The version of SecureLogin that you are using does not handle the version of SecureLogin that is stored in the directory.

Action: Upgrade to the latest version of SecureLogin.

-318: BROKER_DIRECTORY_CRC_DOES_NOT_MATCH

Possible Cause: Whenever SecureLogin stores an entry in Microsoft Active Directory, SecureLogin employs a redundancy check. If the redundancy check does not match when SecureLogin reloads the entry, then the data in Microsoft Active Directory has been corrupted.

Action: Troubleshoot Microsoft Active Directory or Microsoft ADAM.

-319: BROKER_DISALLOWED_DUPLICATE_EXIST

Possible Cause: You entered a password that has unacceptable duplicate characters.

Action: Enter the password correctly.

-320: BROKER_GOTO_LIST_ASSERTION

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-321: BROKER_SUBROUTINE_NOT_DEFINED

Possible Cause: A `Call` command is calling a subroutine that has not yet been defined.

Action: Define the subroutine.

-322: BROKER_UNABLE_TO_FIND_PASSWORD_FIELD

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-323: BROKER_PASSWORD_FIELD_STYLE_NOT_SET

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-324: BROKER_WEB_ACTION_NOT_SUPPORTED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-325: BROKER_ENTRY_MUST_HAVE_NON_NULL_KEY

Possible Cause: You tried to add an application definition or variable that is a blank string.

Action: Provide a name for the application definition or variable.

-326: BROKER_VARIABLE_REQUIRED

Possible Cause: Some commands, for example, ReadText, require a variable to copy the data that they are returning to. The argument must be a variable.

Action: Change the argument to a variable.

-327: BROKER_OBJECT_NOT_FOUND

Possible Cause: Microsoft Active Directory/ADAM library was unable to allocate memory.

Action: Troubleshoot Microsoft Active Directory or Microsoft ADAM.

-328: BROKER_ADS_MEMORY_FAILURE

Possible Cause: The Microsoft Active Directory/ADAM library was unable to allocate memory.

Action: Close one or more applications and try again.

-329: BROKER_ADS_ERROR_GETTING_ATTRIBUTE

Possible Cause: Although data exists in Microsoft Active Directory/ADAM, SecureLogin is unable to read the data.

Action: Troubleshoot Microsoft Active Directory or Microsoft ADAM.

-330: BROKER_ADS_INSUFFICIENT_RIGHTS_TO_DELETE

Possible Cause: When you removed an application definition, SecureLogin tried to delete part of an attribute from Microsoft Active Directory/ADAM. However, you are unable to delete the attribute because you do not have sufficient rights.

Action: The administrator must assign sufficient directory rights for each user object so that the user can modify SecureLogin attributes.

-331: BROKER_ADS_ERROR_DELETING_VALUE

Possible Cause: Microsoft Active Directory/ADAM was unable to delete a value.

Action: Troubleshoot Microsoft Active Directory or Microsoft ADAM.

-332: BROKER_NO_PASSWORD_FIELD_VARIABLE_IN_SCRIPT

Possible Cause: A Web application definition must have at least one `Type` command that has “password” as the second argument.

The following lines illustrate a typical application definition:

- ◆ `Type $Username`
- ◆ `Type $Password Password`

However, the application definition has no `Type` command followed by the `Password` attribute.

Action: Add a `Type` command followed by the `Password` attribute.

-333: BROKER_REGEX_GET_REPLACE_STRING_FAILED

Possible Cause: On the `RegSplit` command, the string that you are running through the regular expression did not match.

Action: Change the regular expression.

-335: BROKER_REGEX_COMPILE_FAILED

Possible Cause: The syntax of the regular expression was incorrect.

Action: Revise the syntax of the regular expression.

-336: BROKER_DIRECTORY_AUTH_DATA_CORRUPT

Possible Cause: The `SecureLogin:SSOAuth` data attribute has become corrupt.

Action: Contact NetIQ Support.

-337: BROKER_DES_KEY_NOT_SET

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-338: BROKER_DES_INVALID_BLOCK_LEN

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-339: BROKER_INVALID_ENCRYPTION_TYPE

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-340: BROKER_UNKNOWN_DATABASE_VERSION

Possible Cause: You are using an earlier version of SecureLogin.

Action: Upgrade to the latest version of SecureLogin.

-341: BROKER_USER_KEY_NOT_SET

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-343: BROKER_PRIMARY_KEY-DECRYPT_FAILED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-344: BROKER_SECONDARY_KEY_DECRYPT_FAILED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-345: BROKER_MERGE_WRONG_ENTRY_TYPE

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-348: BROKER_PASSWORD_RESET_DETECTED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-349: BROKER_UNABLE_TO_FIND_SESSION_FILE

Possible Cause: Terminal Launcher could not find a session file for an emulator.

Action: Configure Terminal Launcher with the correct path to the file for the emulator session.

-352: BROKER_AUTH_DATA_INCORRECT

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-353: BROKER_RECURSIVE_SCRIPT_INCLUDE_DETECTED

Possible Cause: While using the Include command, you included an application definition twice.

Action: Only include an application definition once.

-354: BROKER_NETWORK_PASSWORD_INCORRECT

Possible Cause: You have turned on the option to prompt the user for the network password before the user can access options on the taskbar, and the user entered an incorrect password.

Action: Enter the correct password.

-355: BROKER_USER_ABORTED_LOAD_PROCESS

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-356: BROKER_INVALID_CHARACTER_FOUND_IN_STARTUP_ID_LIST

Possible Cause: For generic emulators, you specify the startup control ID.

A comma must separate a list of numbers. You have used a character other than a comma.

Action: Remove unacceptable characters.

-357: BROKER_ERROR_REG_CACHE_NO_DETAILS

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-358: BROKER_ERROR_REG_CACHE_SAVE_FAILED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-359: BROKER_ERROR_REG_CACHE_SPLIT

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-360: BROKER_PASSWORD_VARIABLE_NOT_ALLOWED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-361: BROKER_NMAS_DLL_NOT_AVAILABLE

Possible Cause: SecureLogin cannot find the DLL file for NMAS for use with the AAVerify command.

Action: To use features for AAVerify, install NMAS.

-362: BROKER_NMAS_LEGACY_RELOGIN_NOT_FOUND

Possible Cause: SecureLogin could not find the NMAS relogin function in the DLL for NMAS.

Action: Install the latest version of NMAS.

-363: BROKER_STANDARD_VARIABLE_REQUIRED

Possible Cause: A ? variable has been used and this command requires a \$ variable.

Action: Provide a \$ variable.

-364: BROKER_LDAP_LOGIN_CANCELLED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-365: BROKER_LDAP_INIT_FAILED

Possible Cause: The initialization of the LDAP SSL layer failed.

Action: Contact NetIQ Support.

-367: BROKER_REG_AUTH_CACHE_MISMATCH

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-368: BROKER_LDAP_TOKEN_DELETED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-369: BROKER_CRED_LIST_NOT_NULL

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-370: BROKER_CRED_LIST_NULL

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-371: BROKER_NO_MORE_CRED_SETS

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-372: BROKER_ACCESS_IS_DENIED

Possible Cause: For LDAP, you do not have rights to the area of the directory that you are trying to access.

Action: Grant user objects the correct rights.

-373: BROKER_HLLAPI-CONNECT_FAILED

Possible Cause: Terminal Launcher was unable to connect to the emulator.

Action: Make sure that the emulator has HLLAPI enabled.

-374: BROKER_DUPLICATE_ENTRIES_EXIST

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-375: BROKER_NOT_RUNNING_NT

Possible Cause: Although you are not running Windows NT, you tried to use a feature that is available only through Windows NT.

Action: Do not use that feature unless you are running Windows NT.

-376: BROKER_WINNT_CACHE_AUTH_REG_FAILED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-377: BROKER_WINNT_CACHE_AUTH_REG_WRONG_USER

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-378: BROKER_INVALID_PIPE_STRING_FOUND

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-379: BROKER_HEX_LENGTH_INCORRECT

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-380: BROKER_HLLAPI_NOT_CONNECTED_TO_PS

Possible Cause: Terminal Launcher tried to use a HLLAPI function. However, the HLLAPI DLL is not connected to the emulator presentation space.

Action: Make sure that Terminal Launcher is set up correctly with the emulator.

-381: BROKER_HLLAPI_SPECIFYING_PARAMETERS_ERROR

Possible Cause: Incorrect parameters were given to a command that uses a HLLAPI function.

Action: Contact NetIQ Support.

-382: BROKER_HLLAPI_INVALID_PS_POSITION

Possible Cause: An attempt was made to move the cursor or read text from an invalid (out of bounds) position on the emulator presentation space.

Action: Correct the positioning parameter in the application definition.

-383: BROKER_HLLAPI_SYSTEM_ERROR

Possible Cause: Terminal Launcher is not configured correctly for the emulator.

Action: Make sure that Terminal Launcher is set up correctly with the emulator and that the emulator correctly supports HLLAPI.

-384: BROKER_HLLAPI_PS_BUSY_ERROR

Possible Cause: A HLLAPI function is being called while the emulator presentation space is unavailable.

Action: Make sure that the emulator is not being used by another HLLAPI application.

-385: BROKER_HLLAPI_INPUT_REJECTED

Possible Cause: The emulator rejected an attempt to input data into the emulator presentation space.

Action: Make sure that the emulator presentation space is not locked.

-386: BROKER_HLLAPI_ERROR_QUERYING_SESSIONS

Possible Cause: SecureLogin is unable to query available HLLAPI sessions.

Action: Make sure that the Terminal Launcher is set up correctly with the emulator.

-387: BROKER_LAST_NDS_USER_NOT_FOUND

Possible Cause: The last NDS or eDirectory user object, as stored in the registry, could not be read for use in an NMAS login.

Action: Make sure the last NDS or eDirectory user object is stored correctly in the registry.

-388: BROKER_LAST_NDS_USER_UNWORTHY

Possible Cause: The last NDS or eDirectory user object, as stored in the registry, was not in the correct format. An NMAS login was unable to use the format.

Action: Make sure the last NDS or eDirectory user object is stored correctly in the registry.

-389: BROKER_NMAS_DISCONNECTED_LOGIN_NOT_FOUND

Possible Cause: NMAS disconnected login function not found in NMAS.DLL.

Action: Make sure that the correct NMAS.DLL is installed.

-390: BROKER_LDAP_SSL_INIT_FAILED

Possible Cause: SecureLogin could not initialize the LDAP SSL libraries.

Action: Contact NetIQ Support.

-391: BROKER_LDAP_SSL_ADD_CERT_FAILED

Possible Cause: SecureLogin could not open the certificate you supplied for LDAP over SSL. Either the file does not exist or it is in the incorrect format. If the certificate file specified ends in .DER, then SecureLogin uses Distinguished Encoding Rule (DER) format. Otherwise SecureLogin uses B64 format.

Action: Make sure that the path to the certificate is correct and that it is in DER format.

-392: BROKER_BUILTIN_VARIABLE_NOT_FOUND

Possible Cause: A built-in variable such as `?sysversion` was not found.

Action: Check that the format of the variable name is `?SysVersion(system)`.

-393: BROKER_SCRIPT_NOT_PURELY_INDEXED

Possible Cause: While working with Web modules, you mix indexed and nonindexed commands.

For example, you entered the following:

```
Type $Username #1
```

```
Type $Password
```

Action: Make sure that all commands use indexes, or remove all indexes.

-394: BROKER_LDAP_PASSWORD_INCORRECT

Possible Cause: The password supplied to log in to LDAP was incorrect.

Action: Check the password.

-395: BROKER_LDAP_USER_NON_EXISTANT

Possible Cause: The user name that you used to log on to LDAP does not exist.

Action: Make sure that the user name exists in the directory and that the LDAP context is correct.

-396: BROKER_LDAP_SERVER_DETAILS_INCORRECT

Possible Cause: One or more of the LDAP server parameters supplied was incorrect.

Action: Check the LDAP server address and port number.

Make sure that the LDAP server you are connected to is running.

-398: BROKER_WIZ_CP_WRONG_SCRIPT_TYPE

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-399: BROKER_DIVIDE_BY_ZERO_IS_BAD

Possible Cause: Using the Divide command, you attempted division by zero.

Action: Do not attempt division by zero.

-400: BROKER_WRONG_SECTION_NAME

Possible Cause: You manually edited a wizard-generated application definition.

Action: When editing an application definition, do not edit the specially generated comments. Only edit the actual commands. If this error occurs, you will no longer be able to use the wizard for that application definition.

-401: BROKER_INVALID_GLOBAL_WIZARD_CONFIG

Possible Cause: You manually edited a wizard-generated application definition.

Action: Do not edit the specially generated comments in an application definition. Only edit the actual commands. If this error occurs, you will no longer be able to use the wizard for that application definition.

-402: BROKER_LDAP_ATTRIBUTE_DOES_NOT_EXIST_IN_SCHEMA

Possible Cause: Either of the following:

- ◆ You are running LDAP on eDirectory, but have not correctly mapped the LDAP attributes.
- ◆ You are running LDAP on a platform other than eDirectory. However, the schema is not extended for that platform.

Action: Check your LDAP attribute mappings. Extend the LDAP schema.

-403: BROKER_AAVERIFY_DLL_NOT_AVAILABLE

Possible Cause: SecureLogin was unable to load `SL_AAVERIFY.DLL`.

Action: Make sure that you have the correct DLLs installed for `AAVERIFY`.

-404: BROKER_AAVERIFY_FUNCTION_NOT_FOUND

Possible Cause: You are using the incorrect version of `SL_AAVERIFY.DLL`.

Action: Check the version of `SL_AAVERIFY.DLL`.

-405: BROKER_AAVERIFY_CONSISTENCY_FAILURE

Possible Cause: You are using the incorrect version of `SL_AAVERIFY.DLL`.

Action: Check the version of `SL_AAVERIFY.DLL`.

-406: BROKER_AAVERIFY_ERROR

Possible Cause: You are using the incorrect version of `SL_AAVERIFY.DLL`.

Action: Check the version of `SL_AAVERIFY.DLL`.

-408: BROKER_DES_KEY_DATA_CORRUPT

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-409: BROKER_OPERATION_ABORTED_BY_USER

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-410: BROKER_NOT_A_STRING_ATTRIBUTE

Possible Cause: You are using % variables, but the attribute you are reading is not a plain string attribute (`SYN_CE_STRING` or `SYN_CI_STRING` on eDirectory).

Action: Check the schema definition of the attribute to confirm that the syntax is `SYN_CE_STRING` or `SYN_CI_STRING`.

-411: BROKER_LDAP_INVALID_DN_SYNTAX

Possible Cause: The format of your LDAP user name was invalid.

Action: Check the format of the user name that you entered.

-412: BROKER_INVALID_OPTION_COMBINATION

Possible Cause: An invalid combination of options was passed to an application definition command.

For example, you passed `-Right` and `-Raw` to the `Click` command.

Action: See the appropriate application definition command.

-413: BROKER_AAVERIFY_SLOGIN_DOES_NOT_EXIST

Possible Cause: `SL_AAVERIFY.DLL` generates these errors. There is a problem connecting to the SecureLogin server.

Action: Troubleshoot service location problems by reviewing documentation on SecureLogin Advanced Authentication.

-414: BROKER_AAVERIFY_ERR_SLOGIN_NOT_RUNNING

Possible Cause: `SL_AAVERIFY.DLL` generates these errors. There is a problem connecting to the SecureLogin server.

Action: Troubleshoot service location problems by reviewing documentation on SecureLogin Advanced Authentication.

-415: BROKER_AAVERIFY_ERR_LOAD_LIB_SLPAM

Possible Cause: `SL_AAVERIFY.DLL` generates these errors. There is a problem connecting to the SecureLogin server.

Action: Troubleshoot service location problems by reviewing documentation on SecureLogin Advanced Authentication.

-416: BROKER_WI_GETEXENAME_ERR

Possible Cause: The wizard was unable to retrieve the executable name for the window you selected.

Action: Do not use the wizard for this application.

-417: BROKER_ADS_PUT_OCTET_INSUFFICIENT_RIGHTS

Possible Cause: You do not have sufficient rights to Microsoft Active Directory/ADAM to perform the current operation.

Action: Ask the directory administrator to assign you additional Microsoft Active Directory/ADAM system rights.

-418: BROKER_ADS_CLR_OCTET_INSUFFICIENT_RIGHTS

Possible Cause: You do not have sufficient rights to Microsoft Active Directory/ADAM to perform the current operation.

Action: Ask the directory administrator to assign you additional Microsoft Active Directory/ADAM system rights.

-420: BROKER-_SLAASSO_ERR_CRYPTO_KEY_NOT_SET

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-421: BROKER_SLASSO_ERR_UNKNOWN_DATA

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-422: BROKER_SLASSO_OUT_OF_MEMORY

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-423: BROKER_ERROR_INITIALISING_DATA_STORES

Possible Cause: SecureLogin was unable to initialize either the primary or secondary datastore.

Action: Contact NetIQ Support.

-424: BROKER_UNABLE_TO_LOAD_SLOTP_DLL

Possible Cause: `SLOTP.DLL` could not be loaded. This DLL is required for synchronizing one-time password to LDAP directories.

Action: Review documentation for one-time passwords.

-425: BROKER_LDAP_NO_SUCH_ATTRIBUTE

Possible Cause: You have used a % variable on LDAP. However, the requested attribute does not exist.

Action: Check the spelling of the attribute name against the LDAP schema.

-426: BROKER_SYS_VARIABLE_NOT_AVAILABLE

Possible Cause: A system variable, for example, `?syspassword`, was requested but was not available. `SLINA.DLL`, `SLNMAS.DLL` or `SLCREDMAN.DLL` must be correctly installed for these variables to function.

Action: Make sure that either `SLINA.DLL`, `SLNMAS.DLL` or `SLCREDMAN.DLL` is installed.

-427: BROKER_USERNAME_UNSUITABLE_FOR_READING_SLINA_CREDS

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-428: BROKER_NO_EXCEPTION_HANDLER_DEFINED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-429: BROKER_EXCEPTOPN_RAISED

Possible Cause: Data has become corrupted, or the software is not working as intended.

Action: Contact NetIQ Support.

-430: BROKER_MUST_BE_CALL_OR_GOTO

Possible Cause: When using the `OnException` command, the second parameter must be `Call` or `GoTo`.

Action: Make sure that `Call` is used with the `OnException` command.

-442: BROKER_CHAR_UCASE_NOT_IN_REQUIRED_POSITION

Possible Cause: There is not an uppercase character in a position where one is required.

Action: Check the password for compliance with the Password Policy.

-443: BROKER_CHAR_LCASE_NOT_IN_REQUIRED_POSITION

Possible Cause: Raised by the Password Policy code if there is not a lower case character in a position where one is required.

Action: Check the password for compliance with Password Policy.

-444: BROKER_PUNCTUATION_NOT_IN_REQUIRED_POSITION

Possible Cause: There is not a punctuation character in a position where one is required.

Action: Check password for compliance with Password Policy.

-477: BROKER_UNABLE_TO_GET_REGISTRY_DATA

Possible Cause: The SecureLogin application definition `GetReg` command could not read the required registry information.

Action: Contact NetIQ Support.

-478: BROKER_ERROR_PARSING_PARAMETER

Possible Cause: The registry entry name passed to the SecureLogin application definition `GetReg` command was incorrect.

Action: Make sure that the name begins {HKCR, HKCC, HKCU, HKLM, or HKU} and corresponds to one of the Windows registry hives. Also, it must contain the path to the desired registry entry within the node.

-481: BROKER_AUTH_QUERY_ON_WRONG_OBJECT_TYPE

Possible Cause: SecureLogin has attempted to load data from a directory object of an incorrect type.

Action: Contact NetIQ Support.

-482: BROKER_VERSION_NO_ROLL_BACK

Possible Cause: The SecureLogin datastore version cannot be returned to an older datastore version after it has been set to version 6.0.

Action: Contact NetIQ Support.

-483: BROKER_SECURE_CONNECTION_REQUIRED

Possible Cause: SecureLogin cannot load sensitive data from the server over insecure connections.

Action: Contact NetIQ Support.

-500: BROKER_ERROR-ACCOUNT-EXPIRED

Possible Cause: SecureLogin was unable to authenticate your Active Directory account because your user account has expired.

Action: Contact your system administrator.

-501: BROKER_ERROR_ACCOUNT_DISABLED

Possible Cause: SecureLogin was unable to authenticate your Active Directory account because your user account has been disabled.

Action: Contact your system administrator.

-502: BROKER_ERROR_ACCOUNT_LOCKED

Possible Cause: SecureLogin was unable to authenticate your Active Directory account because your user account has been locked.

Action: Contact your system administrator.

-503: BROKER_ERROR_PASSWORD_EXPIRED

Possible Cause: SecureLogin was unable to authenticate your Active Directory account because your password has expired.

Action: Change your Active Directory password or contact your system administrator.

-600: BROKER_NONFIR_INVALID_TARGET

Possible Cause: A non-directory datastore is unable to load the local rule that contains the required data for an object. This could be because of the following:

- ◆ Insufficient user permissions.
- ◆ File failed to download.
- ◆ File has been deleted.

Action: Contact your system administrator.

-2147016656: Error opening specified object

Possible Cause: Microsoft Active Directory code error message (value 0x80072031): There is no such object on the server.

Action: You have entered an incorrect object or container definition when assigning user rights. Reenter the correct object or container definition.

B Schema Updates

- ◆ [Section B.1, “Schema Attributes,” on page 239](#)
- ◆ [Section B.2, “Active Directory Environments,” on page 239](#)
- ◆ [Section B.3, “LDAP Environments,” on page 242](#)
- ◆ [Section B.4, “Security Rights Assignments,” on page 244](#)

B.1 Schema Attributes

SecureLogin adds six schema attributes to the directory. The attributes are added during installation using the appropriate schema extension tool, depending on your choice of directory for SecureLogin data storage. In Active Directory and Active Directory with LDAP environments, `adsschema.exe` is used. For Novell NDS or eDirectory environments, `ldapschema.exe` and `ndsschema.exe` is used.

These attributes are required for the encryption and storage of SecureLogin data against directory objects such as user objects and organizational units. The following descriptions include the type of data stored for each attribute and the security rights required to permit the data to be saved for the SecureLogin client.

Before installing SecureLogin, you need to extend the directory schema. For information about extending the schema, see [“Configuring and Deploying in an eDirectory Environment”](#) in the *SecureLogin 9.1 Installation Guide*.

Run the schema tool while upgrading SecureLogin to ensure that not only the schema is extended properly but also the appropriate rights are set for objects accessed by SecureLogin.

B.2 Active Directory Environments

In Active Directory environments, `adsschema.exe` is used.

- ◆ [Section B.2.1, “Protocom-SSO-Auth-Data,” on page 239](#)
- ◆ [Section B.2.2, “Protocom-SSO-Entries,” on page 240](#)
- ◆ [Section B.2.3, “Protocom-SSO-Entries-Checksum,” on page 240](#)
- ◆ [Section B.2.4, “Protocom-SSO-Profile,” on page 240](#)
- ◆ [Section B.2.5, “Protocom-SSO-Security-Prefs,” on page 241](#)
- ◆ [Section B.2.6, “Protocom-SSO-Security-Prefs-Checksum,” on page 241](#)

B.2.1 Protocom-SSO-Auth-Data

This attribute contains all user-specific authentication data, such as the passphrase.

| | |
|----------------|------------------------|
| Attribute Name | Protocom-SSO-Auth-Data |
|----------------|------------------------|

| | |
|---------------------|----------------------------|
| Classes assigned to | User |
| Syntax | Octet String |
| Optional Flags | Synchronize |
| X.500 OID | 1.2.840.113556.1.8000.60.2 |

B.2.2 Protocom-SSO-Entries

This attribute contains the following:

- ♦ All the user's login credentials, including passwords.
- ♦ Specific preferences and application definitions at the user object.
- ♦ Corporate application definitions and preferences at the container and organizational unit objects.

| | |
|---------------------|----------------------------|
| Attribute Name | Protocom-SSO-Entries |
| Classes assigned to | Container |
| | Organizational Unit |
| | User |
| Syntax | Octet String |
| Optional Flags | Synchronize |
| X.500 OID | 1.2.840.113556.1.8000.60.1 |

B.2.3 Protocom-SSO-Entries-Checksum

This attribute stores a checksum so that the single sign-on client can easily determine whether a complete reload of single sign-on adapter information is required.

| | |
|---------------------|-------------------------------|
| Attribute Name | Protocom-SSO-Entries Checksum |
| Classes assigned to | Container |
| | Organizational Unit |
| | User |
| Syntax | Octet String |
| Optional Flags | Synchronize |
| X.500 OID | 1.2.840.113556.1.8000.60.5 |

B.2.4 Protocom-SSO-Profile

This attribute stores the address of the organizational unit to be redirected to.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Profile |
| Classes assigned to | Container Organizational Unit User |
| Syntax | Distinguished Name |
| Optional Flags | Synchronize |
| X.500 OID | 1.2.840.113556.1.8000.60.7 |

B.2.5 Protocom-SSO-Security-Prefs

This attribute stores the data required for advanced passphrase policies, including administrator set passphrase questions and passphrase help information and settings.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Security-Prefs |
| Classes assigned to | Container Organizational Unit User |
| Syntax | Octet String |
| Optional Flags | Synchronize |
| X.500 OID | 1.2.840.113556.1.8000.60.3 |

B.2.6 Protocom-SSO-Security-Prefs-Checksum

A checksum used to optimize reading of the Security Preference attribute.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Security-Prefs-Checksum |
| Classes assigned to | Container Organizational Unit User |
| Syntax | Octet String |
| Optional Flags | Synchronize |
| X.500 OID | 1.2.840.113556.1.8000.60.6 |

B.3 LDAP Environments

In LDAP environments, `ldapschema.exe` is used.

- ◆ [Section B.3.1, “Protocom-SSO-Auth-Data,” on page 242](#)
- ◆ [Section B.3.2, “Protocom-SSO-Entries,” on page 242](#)
- ◆ [Section B.3.3, “Protocom-SSO-Entries-Checksum,” on page 242](#)
- ◆ [Section B.3.4, “Protocom-SSO-Profile,” on page 243](#)
- ◆ [Section B.3.5, “Protocom-SSO-Security-Prefs,” on page 243](#)
- ◆ [Section B.3.6, “Protocom-SSO-Security-Prefs-Checksum,” on page 243](#)
- ◆ [Section B.3.7, “Protocom-SSO-Connections,” on page 244](#)
- ◆ [Section B.3.8, “Protocom-SSO-ConnectionLimit,” on page 244](#)
- ◆ [Section B.3.9, “Protocom-SSO-ConnectionTimeToLive,” on page 244](#)

B.3.1 Protocom-SSO-Auth-Data

This attribute contains all user-specific authentication data, such as the passphrase.

| | |
|---------------------|------------------------------|
| Attribute Name | Protocom-SSO-Auth-Data |
| Classes assigned to | User |
| OID | 2.16.840.1.113719.2.26.4.1.1 |

B.3.2 Protocom-SSO-Entries

This attribute contains the following:

- ◆ All the user's login credentials, including passwords.
- ◆ Specific preferences and application definitions at the user object.
- ◆ Corporate application definitions and preferences at the container and organizational unit objects.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Entries |
| Classes assigned to | Container Organizational Unit User |
| OID | 2.16.840.1.113719.2.26.4.2.1 |

B.3.3 Protocom-SSO-Entries-Checksum

This attribute stores a checksum so that the single sign-on client can easily determine whether a complete reload of single sign-on adapter information is required.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Entries Checksum |
| Classes assigned to | Container Organizational Unit User |
| OID | 2.16.840.1.113719.2.26.4.5.1 |

B.3.4 Protocom-SSO-Profile

This attribute stores the address of the organizational unit to be redirected to.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Profile |
| Classes assigned to | Container Organizational Unit User |
| OID | 2.16.840.1.113719.2.26.4.17.1 |

B.3.5 Protocom-SSO-Security-Prefs

This attribute stores the data required for advanced passphrase policies including administrator set passphrase questions and passphrase help information and settings.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Security-Prefs |
| Classes assigned to | Container Organizational Unit User |
| OID | 2.16.840.1.113719.2.26.4.4.1 |

B.3.6 Protocom-SSO-Security-Prefs-Checksum

A checksum used to optimize reading of the Security Preference attribute.

| | |
|---------------------|--|
| Attribute Name | Protocom-SSO-Security-Prefs-Checksum |
| Classes assigned to | Container Organizational Unit User |
| OID | 2.16.840.1.113719.2.26.4.6.1 |

B.3.7 Protocom-SSO-Connections

This attribute stores the connection information, ie., the ip address along with the timestamp.

| | |
|---------------------|------------------------------|
| Attribute Name | Protocom-SSO-Connections |
| Classes assigned to | User |
| OID | 2.16.840.1.113719.2.26.4.7.1 |

B.3.8 Protocom-SSO-ConnectionLimit

This attribute stores the configuration parameter indicating the number of concurrent connections that are allowed for the user.

- ♦ The value of this parameter can be set between 0 and 32.
- ♦ The default value is 0, where 0 indicates that unlimited connections are allowed and the feature is disabled for the user.

| | |
|---------------------|------------------------------|
| Attribute Name | Protocom-SSO-ConnectionLimit |
| Classes assigned to | User |
| OID | 2.16.840.1.113719.2.26.4.7.2 |

B.3.9 Protocom-SSO-ConnectionTimeToLive

This attribute stores the configuration parameter that indicates how long the connection information will be stored. The value is stored in minutes.

- ♦ The value of this parameter can be set between 0 and 65536 (Slightly more than 45 days).
- ♦ The default value is 65536. This indicates that any entry in the `Protocom-SSO-Connections` attribute that is older than 45 days is considered outdated and hence will be removed.

| | |
|---------------------|-----------------------------------|
| Attribute Name | Protocom-SSO-ConnectionTimeToLive |
| Classes assigned to | User |
| OID | 2.16.840.1.113719.2.26.4.7.3 |

B.4 Security Rights Assignments

- ♦ [Section B.4.1, “User-Based Attributes,” on page 244](#)
- ♦ [Section B.4.2, “Container-Based Attributes,” on page 245](#)

B.4.1 User-Based Attributes

The directory user objects for people using the SecureLogin requires the following attribute rights against their own objects.

| Attribute Name | Entry Rights Required |
|---|------------------------------|
| Protocom-SSO-Auth-Data | Read/Write |
| Protocom-SSO-Entries | Read/Write |
| Protocom-SSO-Entries-Checksum | Read/Write |
| Protocom-SSO-Profile | Read/Write |
| Protocom-SSO-Security-Prefs | Read/Write |
| Protocom-SSO-Security-Prefs-Checksum | Read/Write |
| Protocom-SSO-Connections | Write/Public Read |
| Protocom-SSO-ConcurrentConnectionLimit | Public Read |
| Protocom-SSO-ConcurrentConnectionTimeToLive | Public Read |

B.4.2 Container-Based Attributes

In addition, users require the following directory attribute rights against all container objects.

| Attribute Name | Entry Rights Required |
|--------------------------------------|------------------------------|
| Protocom-SSO-Entries | Read |
| Protocom-SSO-Entries-Checksum | Read |
| Protocom-SSO-Profile | Read |
| Protocom-SSO-Security-Prefs | Read |
| Protocom-SSO-Security-Prefs-Checksum | Read |
