About This Guide

This guide provides information about the interface and the layout of wizards, using wizards to enable applications for single sign-on.

Additional Documentation

For the latest version of this guide and other SecureLogin documentation resources, see the [SecureLogin Documentation](#) and keep up to date on patches and versions of both SecureLogin and the host operating system.

Contact Information

We want to hear your comments and suggestions about this book and the other documentation included with this product. You can use the [comment on this topic](#) link at the bottom of each page of the online documentation.

For specific product issues, contact Micro Focus Customer Care at <https://www.microfocus.com/support-and-services/>.

1 Introduction

In this Chapter

- ♦ [What Is an Application Definition](#)
- ♦ [The Application Definition Wizard](#)

1.1 What Is an Application Definition

An application definition is a set of instructions that SecureLogin follows to perform tasks on Windows applications, Java applications, or web pages. For example, you can use an application definition to save user login credentials, so users don't need to type a username and password every time they want to access an application.

NOTE: Throughout the document, all web, Windows, and Java applications are referred to as applications.

An application definition is a collection of instructions that handle multiple operations associated with credentials of the application such as login, change password, application prompts, application notifications. It contains specific instructions that allow the software client to analyze an application after it is launched and determine whether some specific actions need to be performed.

Application definitions specify how SecureLogin interacts with an application to use a SSO credential. SecureLogin comes with predefined application definitions for many commercial applications.

You can use the predefined application definitions or create new application definition to enable single sign-on (SSO) for applications. You can also use application definitions to assign instructions for each dialog box or screen that an application displays. You can define actions for a selected window, a login screen, or an entire application. Application definitions can also include commands to automate password changes on behalf of users and to request user input when required.

Application definitions are stored and secured within the directory to ensure maximum security, support for single-point administration, and for manageability.

1.2 The Application Definition Wizard

The Application Definition Wizard provides an easy and intuitive interface to create new user-specific application definitions. It also manages the user-specific credentials and tasks that SecureLogin performs on multiple applications, including the following:

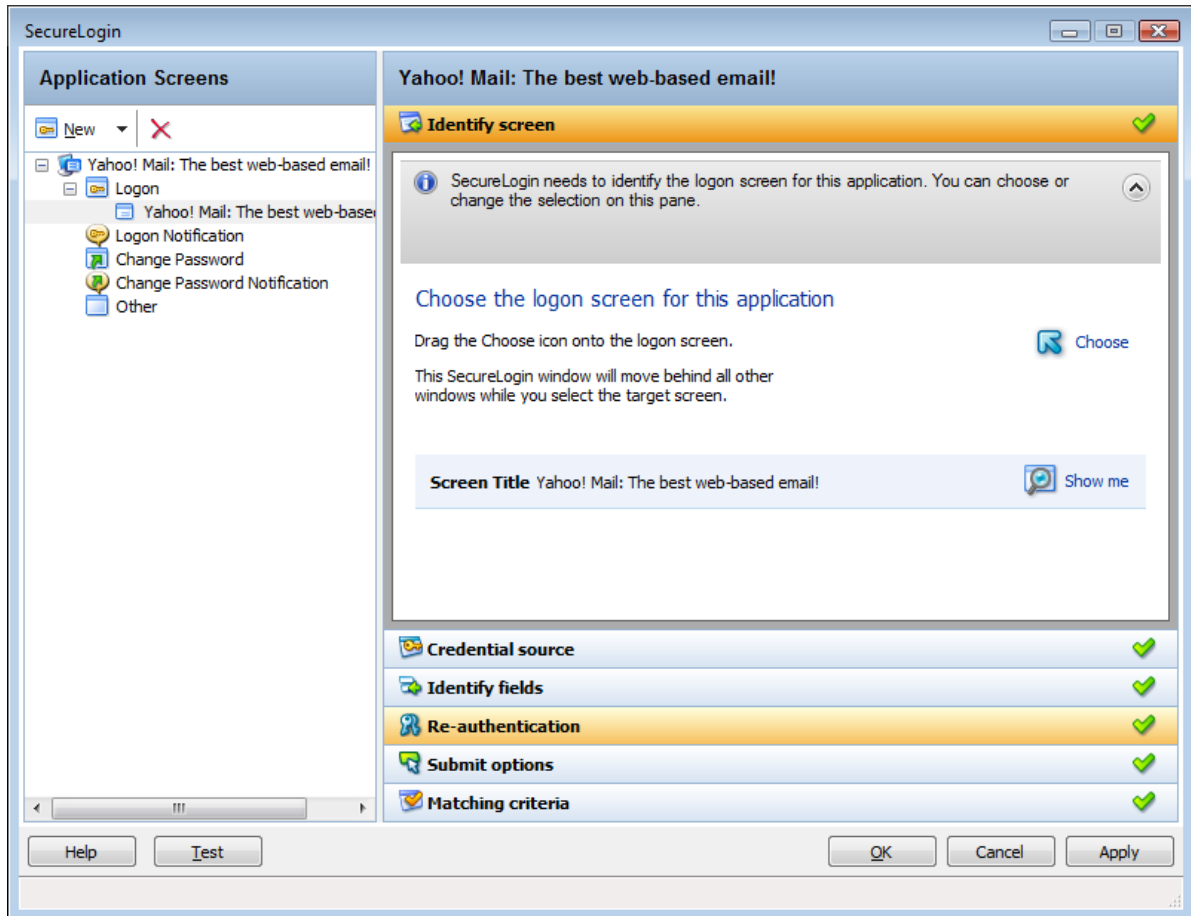

- ♦ Retrieving and entering login details.
- ♦ Automating many login processes, including multi-page logins and login panels that require miscellaneous information such as surnames, telephone numbers, or IP addresses. These can also be stored in the directory.

When you log in to an application for the first time, if you have permission to create an application definition, you are prompted to create an application definition if SecureLogin is active on your workstation.

Although you can enable various types of application for SSO using the application definition wizard, some specific applications cannot be enabled for SSO. For information about such applications, see [Chapter 8, “Limitations, Tips, and Troubleshooting,” on page 115](#).

2 Understanding the Application Definition Wizard Interface

Figure 2-1 The Application Definition Wizard Interface

The user interface of SecureLogin Application Definition Wizard includes various forms that help in managing the application definitions.

The wizard page has the following main components on the interface:

- Section 2.1, “The Application Screens Pane,” on page 10
- Section 2.2, “Attributes Pane,” on page 50
- Section 2.3, “General Controls and Messages,” on page 50
- Section 2.4, “Selecting and Identifying Screens and Controls,” on page 51
- Section 2.5, “Recording Keystrokes,” on page 52
- Section 2.6, “Using Regular Expressions,” on page 53

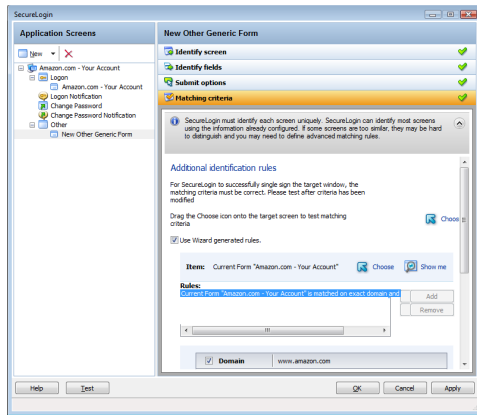

2.1 The Application Screens Pane

The **Application Screens** pane is shown on the left side of the Application Definition Wizard interface.

The **Applications Screens** pane has a list of the application forms enabled for single sign-on, change password, notifications, and others.

The advanced options are displayed only if you select them.

Figure 2-2 The Application Screens Pane

The **Application Screens** pane contains the following menus:

- ♦ Section 2.1.1, “Logon,” on page 10
- ♦ Section 2.1.2, “Login Notification,” on page 23
- ♦ Section 2.1.3, “Change Password,” on page 29
- ♦ Section 2.1.4, “Change Password Notification,” on page 37
- ♦ Section 2.1.5, “Other,” on page 45

2.1.1 Logon

You can create application definitions for a login screen through the **Logon** screen. Complete the following tasks:

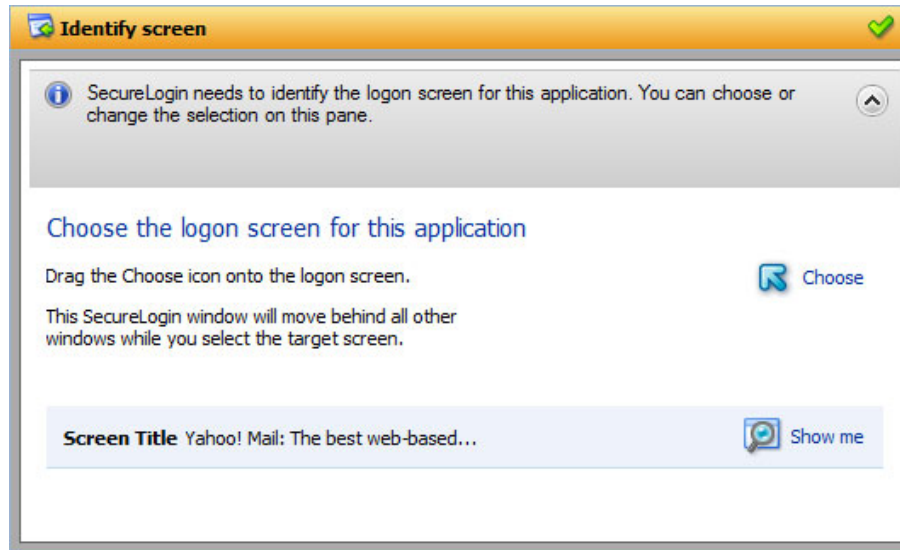

- ♦ “Identifying the Screen” on page 11
- ♦ “Selecting the Credential Source” on page 11
- ♦ “Identifying the Fields” on page 13
- ♦ “All Fields” on page 15
- ♦ “Specifying Re-authentication” on page 17
- ♦ “Selecting the Submit Options” on page 19
- ♦ “Determining the Matching Criteria” on page 21

These are displayed in the Section 2.2, “Attributes Pane,” on page 50.

Identifying the Screen

SecureLogin identifies the login screen of the application for which you want to enable single sign-on. You can use the **Identify screen** attribute to select or change the login screen of the application.

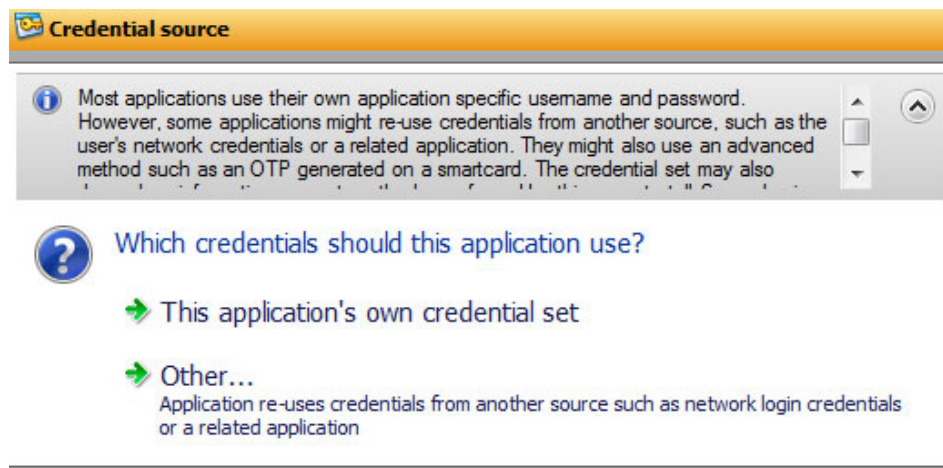

Figure 2-3 The Identify Screen

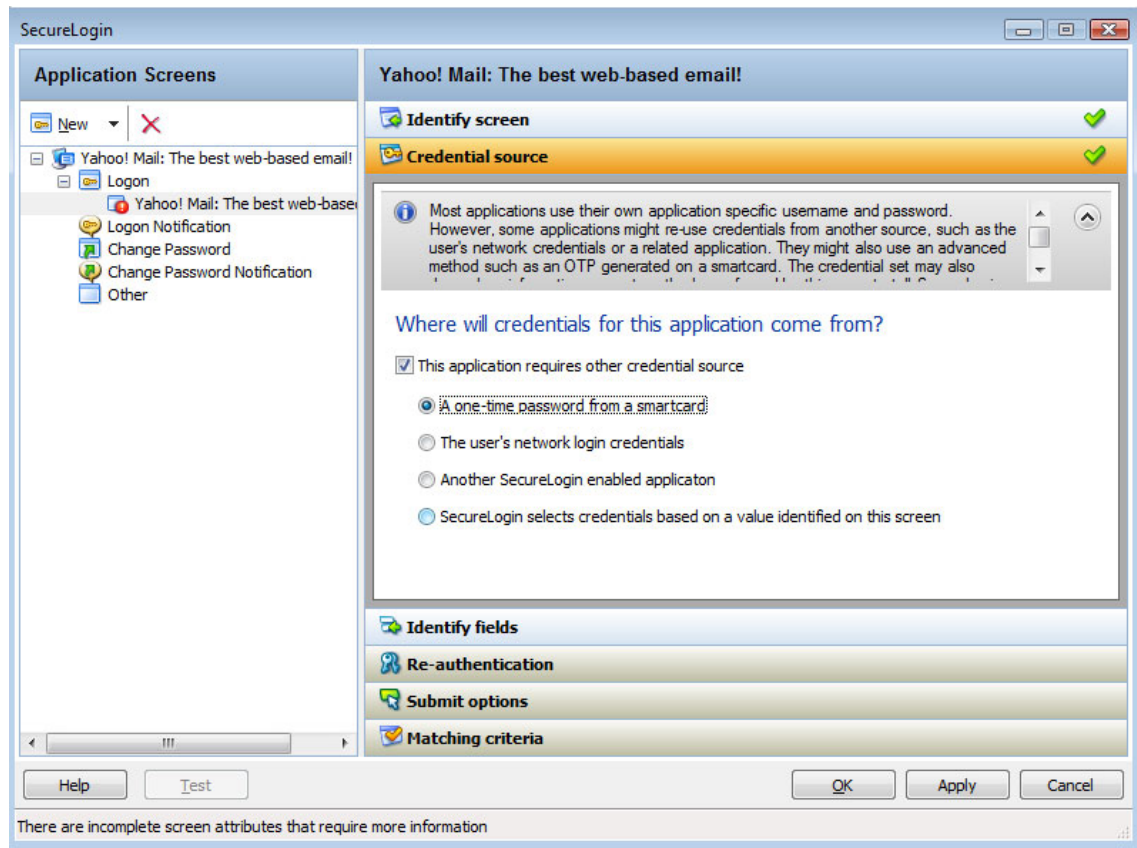

- 1 In the Application Screens pane of the wizard, select the login screen by dragging the **Choose**  icon to the login screen.
- 2 Click the **Show me**  icon to highlight the selection made by the wizard.

Selecting the Credential Source

- 1 Use the **Credential source** menu to select the credentials that SecureLogin must use in an application. Typically, you can have only one credential set for an application. If a second login is enabled with different credential set, it replaces the first set of credentials.

- 2 Select **This application's own credential set** to allow SecureLogin create a discrete set of credentials for the application. The credential set is recognized by the name of the application.

- 3 Select **Other** to choose another source of credentials for the application. You choose from the following sources.
- ♦ **A one-time password from a smart card:** Select this option to use a one-time password from a smart card to log in to the application.
 - ♦ **The user's network logon credentials:** Select this option to use the user's directory credentials to log in to the application.
 - ♦ **Another SecureLogin enabled application:** Select this option to use the credentials of another application that is already enabled for single sign-on. Select a credential set from the list of applications displayed under **Another SecureLogin enabled application**.

Figure 2-4 Selecting Another Application's Credentials

- ♦ **SecureLogin selects credentials based on a value identified on this screen:** Select this option when the login information for an application is determined by the presence of a particular value in the login screen. You can specify a text value in the field.

Regular expressions are supported. For example, you can specify a regular expressions such as:

Connecting to server (.*)

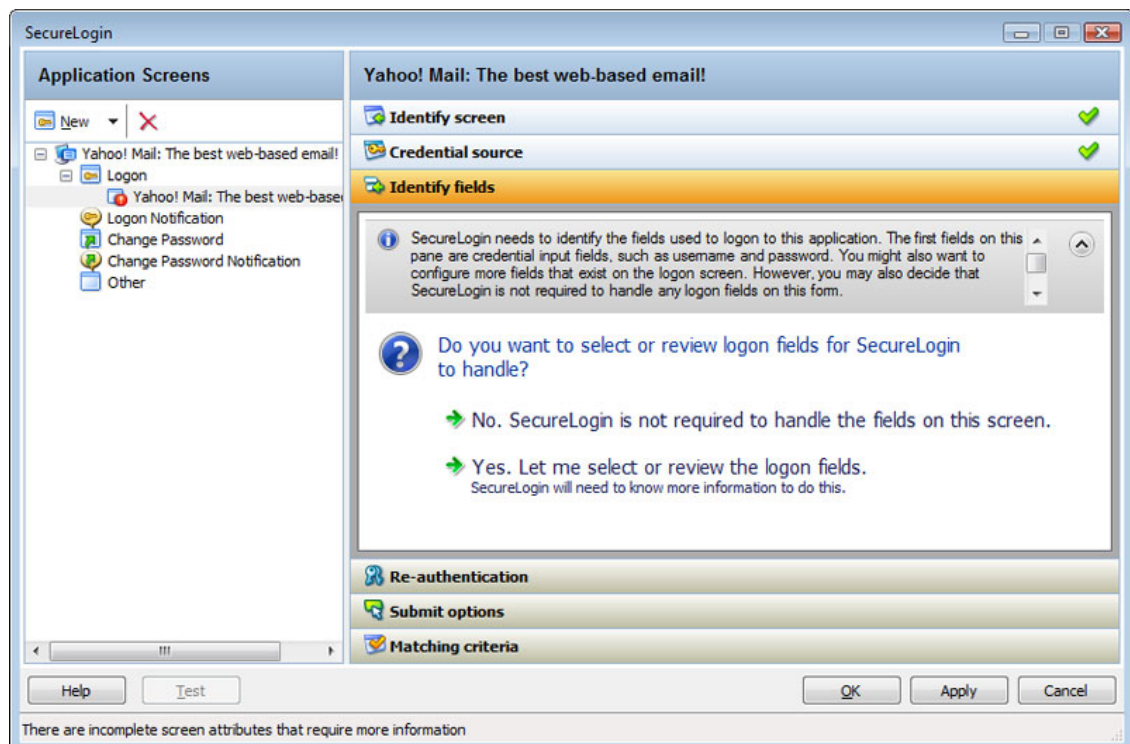

The (. *) specifies the value that must be captured to define the credentials. You can have one credential set for each regular expression value.

Figure 2-5 *Selecting Credentials Based on a Value*

Identifying the Fields

- 1 Use **Identify fields** to review or change the selection of fields recognized by the wizard.
- 2 If you select **No. SecureLogin is not required to handle the fields on this screen**, SecureLogin does not handle any fields detected on the application. Use this option to create a common credential set that you can use with several applications. You can link other application definitions to this common credential set.

- 3 If you select **Yes. Let me select or review the logon fields**, you can review and confirm if the fields are selected correctly by the wizard.

By default, SecureLogin uses the field names as the prompts in its dialog boxes. You can edit the field names for more clear and user-friendly names.

- 4 If the fields are not identified correctly, drag the **Choose**  icon to the fields and click **Show me**. The identified fields are highlighted.

The 'Identify fields' dialog box has a yellow title bar with a green checkmark icon. Below the title bar is a grey bar with an information icon and the text 'SecureLogin needs to identify the fields used to login to this application....'. A checkbox labeled 'Select or review login fields.' is checked. The main area contains two sections: 'Username:' and 'Password:'. Each section has a text input field, a 'Choose' button with a blue arrow icon, and a 'Show me' button with a magnifying glass icon. Below each input field are two checkboxes: 'Treat field as sensitive field' and 'Navigate to field using keystrokes'. The 'Username' section has 'Yahoo! ID:' as the label and the input field contains 'Yahoo! ID:'. The 'Password' section has 'Password:' as the label and the input field contains 'Password:'. At the bottom, there is a text area labeled 'Prompt:' with the text 'Please edit your login variables.' and a vertical scrollbar on the right side.

- 5 Select **Treat text field as a sensitive field** to hide the characters with asterisks. This choice is optional for a username, but selected by default for a password.
- 6 Select **Navigate to field using keystrokes**, if you cannot identify the correct field through other methods.
- 6a Click **Start**.
- 6b Specify the keystrokes.

The 'SecureLogin' dialog box has a blue title bar. The main area has a blue header with the text 'Please select the form you are scripting'. Below this is a section labeled 'Keystrokes recorded:' with a text input field containing '<alt><shift+><\\45>'. To the right of the input field is a 'Close' button.

- 6c Click **Close** to return to the **Identify fields** menu.
- 6d Click **Stop** to stop the recording.
- SecureLogin begins using the specified keystrokes at the subsequent login.

All Fields

- 1 Click **All Fields** to show other fields detected by the wizard on the login screen. Each control is listed by type and name (if known).

<input type="checkbox"/>	TextBox
<input type="checkbox"/>	TextBox
<input type="checkbox"/>	CheckBox
<input type="checkbox"/>	ComboBox
<input type="checkbox"/>	RadioButton
<input type="checkbox"/>	RadioButton

When the Application Definition Wizard retrieves the default controls such as the username and password fields, they are identified as primary controls and identified in **Identify Fields** menu. See [Figure 2-8 on page 24](#).

These controls are also listed with all other controls in the **All Fields** menu. By default, they are selected and dimmed. However, if you use **All Fields** to set the control definitions for primary controls selected in **Identify Fields**, the selections made in the **Identify Fields** menu is updated.

The other fields are:

- ♦ [“Edit Box” on page 15](#)
- ♦ [“Check Box” on page 16](#)
- ♦ [“Combo Box” on page 16](#)
- ♦ [“Radio Button” on page 17](#)

Edit Box

- 1 If an edit box is detected, use the **Action** list to configure SecureLogin to:
 - ♦ **Ask the user to enter a value into field:** Specify a user-friendly name and a message to prompt users to specify a value.

☒ **EditBox** Show me

What should SecureLogin do with this field?

Action:

Ask the user to enter a value into field ▼

☒ Remember first value entered

Type a user-friendly name to describe this value in the user's credential set

User-Friendly Name:

User name

☐ Treat as sensitive field

Type the prompt that SecureLogin displays when the user is asked for this value

Prompt:

User name:

NOTE: If you select **Remember first value entered**, SecureLogin saves the first value entered in this field and automatically enter it on all subsequent logins.

The **User-Friendly Name** is also used as the variable name in the SecureLogin Client Utility.

Select **Treat as sensitive field** to treat the username field like a password field and hide the characters with asterisks.

- ♦ **Use the value selected below for all users:** Specify the message that SecureLogin displays.

Check Box

- 1 If a check box is detected, use the action **Use the value selected below for all users** to select whether the check box is to be selected or deselected.

The screenshot shows a configuration window titled "CheckBox" with a subtitle "This is a checkbox". The main area contains the text "What should SecureLogin do with this field?". Below this, there is an "Action:" label followed by a dropdown menu currently showing "Use the value selected below for all users". Underneath, there is a label "Select a value for the checkbox:" followed by another dropdown menu. This second dropdown menu is open, showing two options: "Unchecked" (which is highlighted) and "Checked". At the bottom right of the window, there is a "Show me" button with a magnifying glass icon.

Combo Box

If a drop-down list box or any other kind of combination box is detected, use the **Action** to configure SecureLogin to:

- ♦ **Use the value selected below for all users:** If you select **Use the value selected below for all users**, specify the option SecureLogin selects. This is the only option available for combo boxes in Web applications.
- ♦ **Ask the user to select from the list that the application presents:** If you select **User is to select from the list the application presents**, specify a name for the value and the text used to prompt users. This option is not available for web applications.

If you select **Remember the value the user selects and do not prompt again**, SecureLogin stores and automatically enter this value into this screen in the future.

Figure 2-6 Specifying Values for a Combo Box

The screenshot shows a configuration window titled "ComboBox" with a subtitle "Select a Server...". It includes a "Show me" button. The main content area asks "What should SecureLogin do with this field?". Under the "Action:" section, a dropdown menu is set to "User is to select from the list that the application presents". Below this, there is a checked checkbox for "Remember the value the user selects and do not prompt again". A text prompt asks to "Type a user-friendly name to describe this value in the user's credential set", followed by a text input field. There is also an unchecked checkbox for "Treat as sensitive field". Another text prompt asks to "Type the prompt that SecureLogin displays when the user is asked for this value", followed by another text input field.

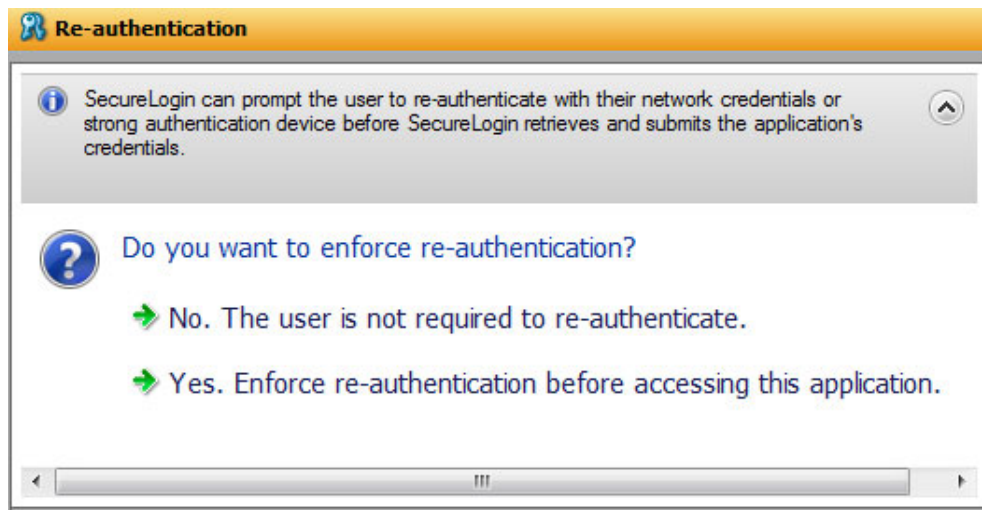

Radio Button

If a radio button is detected, use the **Use the value selected below for all users** action to select whether the radio button is selected or not.

The screenshot shows a configuration window titled "RadioButton" with a subtitle "Radio1". It includes a "Show me" button. The main content area asks "What should SecureLogin do with this field?". Under the "Action:" section, a dropdown menu is set to "Use the value selected below for all users". Below this, a text prompt asks to "Select a value for the Radio button:", followed by a dropdown menu. This dropdown menu is open, showing two options: "Not Selected" (which is highlighted) and "Selected".

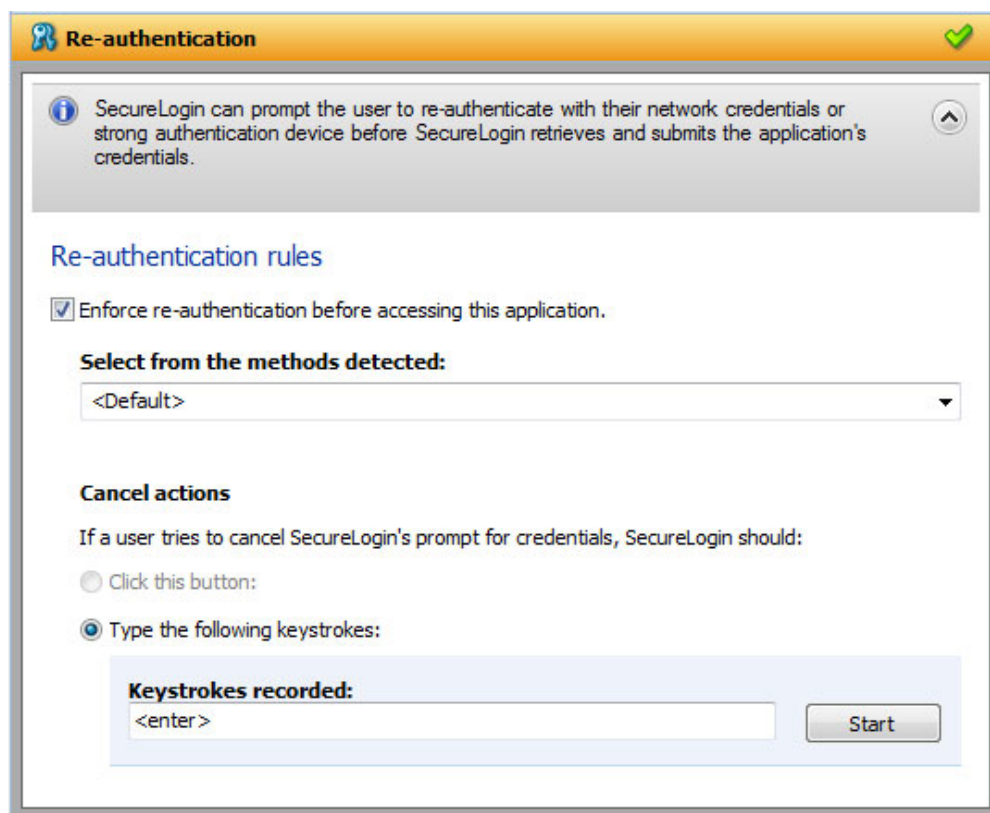

Specifying Re-authentication

- 1 Use the **Re-authentication** menu to specify how users must re-authenticate. Specify whether they must re-authenticate with their network credentials or by using an authentication device.

- 2 If you select **No. The user is not required to re-authenticate**, SecureLogin does not prompt users to re-authenticate before providing the credentials to the application.

If you select **Yes. Enforce re-authentication before accessing this application**, users must specify the credentials that SecureLogin uses to re-authenticate the user's identity.

- 3 From the **Select from the methods detected** drop-down list, select the method SecureLogin must use to authenticate the credentials. You can select one of the following options:
- ♦ **Default:** The method the user used to log in to the application.
 - ♦ **Use same credentials as network login:** Use the network login credentials.

- ♦ **Password:** The network password.
- ♦ **Smart card:** After the PIN is verified, SecureLogin checks to see if the smart card is available to the user.

You must also specify the action for SecureLogin to take when the user cancels re-authentication. You can define one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user cancels the re-authentication dialog box. Select and highlight the button by dragging the **Choose** icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters when a user clicks **Cancel** on the re-authentication dialog box. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.

Selecting the Submit Options

- 1 Use the **Submit options** menu to define how SecureLogin submits the login screen.

- 2 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the login screen.
- 3 If you select **SecureLogin submits the screen**, specify the action that SecureLogin must take to submit the login screen.

A dialog box titled "Submit options" with a green checkmark icon in the top right corner. It contains an information icon and a text block explaining the purpose of the options: "Use these options to tell SecureLogin how to submit the logon screen. The submit action could be pressing a button. Alternatively, SecureLogin may do nothing and allow the user to submit the screen." There is a small upward arrow icon in the top right corner of the dialog box.

Login actions

☒ SecureLogin submits the logon screen

How should SecureLogin submit this screen?

☐ Click this button:

☒ Type the following keystrokes:

Keystrokes recorded:

Start

☐ Enable action when user cancels to enter their credentials

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Enable action when user cancels to enter their credentials:** If you select this option, specify the action SecureLogin takes when a user cancels credential entry.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user cancels the prompt for credentials. Select and highlight the button by dragging the **Choose** icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters when a user cancels the prompt for credentials. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

Determining the Matching Criteria

- 1 SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

Would you like to define advanced matching rules?

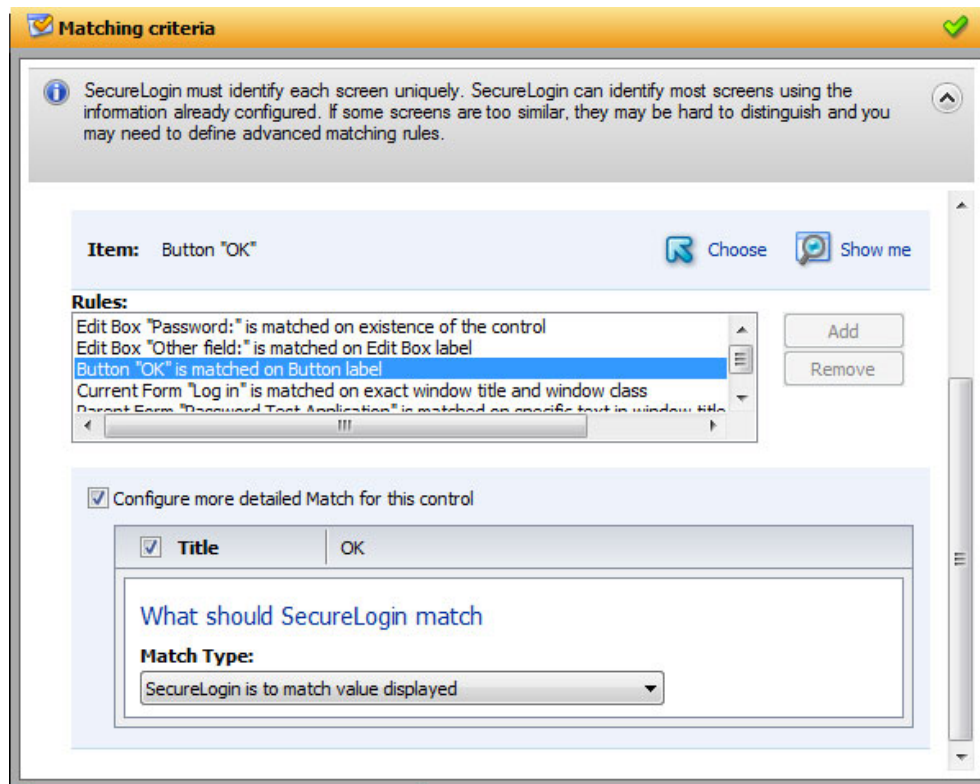

- ➔ No. Use minimal rules based on your previous selections.
- ➔ Yes. Use additional Wizard generated rules.
Useful if the screen is similar to another SecureLogin enabled screen or some controls on screen appear to be dynamically created.

- 2 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle an application.
- 3 If you select **Yes. Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule.

By default, **Use Wizard generated rules** is selected. The **Rules** text box lists the controls detected by SecureLogin. You can add a new rule by dragging the **Choose** icon to a specific control and clicking **Show me** to confirm that SecureLogin has identified the correct control.

To modify a rule for a control:

- 1 Select the rule you want to edit, then select **Configure more detailed match for this control**.

2 Define what SecureLogin must match. You can set one of the following matching rules:

- ♦ **SecureLogin is to match value displayed:** If you select this option, SecureLogin only matches those screens that exactly match the displayed text and rules identified.

If **Name** is available, it is selected by default. If it is not available and **ID** is available, then **ID** is selected for matching by default.

- ♦ **SecureLogin is to match specific part of the identified ctrl:** If you select this option, you must use a regular expression to define and match the screen features. You cannot use special characters in a regular expression.

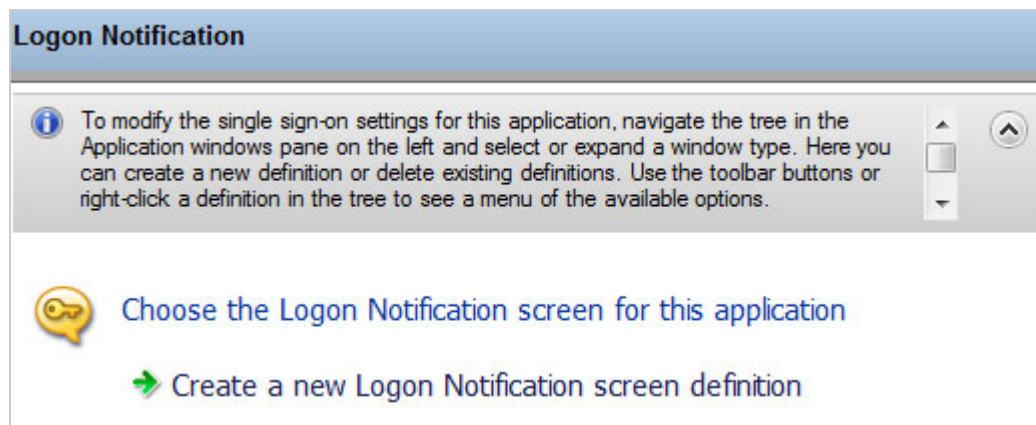

To test a regular expression: Click **Test Match**. If a regular expression does not match any control on the application screen, SecureLogin prompts you to verify your regular expression and select the correct control.

To delete a rule: Select the rule and click **Remove**.

2.1.2 Login Notification

A login notification is a message that the application displays after SecureLogin has submitted the credentials, such as an error message indicating an incorrect password. Use the **Logon Notification** options to define how SecureLogin handles notifications in your application definition.

Figure 2-7 Login Notification Screen

To define an application definition or login notifications, You must complete the following tasks:

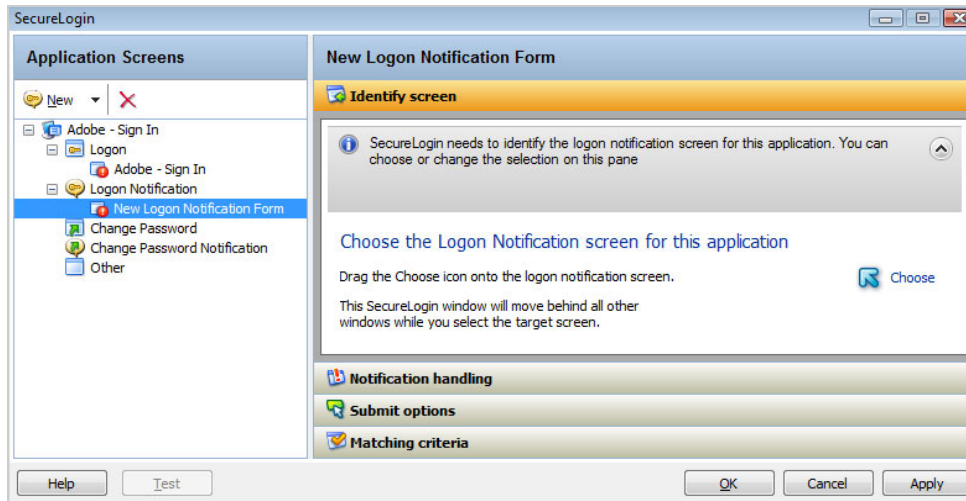

- ♦ “Identifying the Screen” on page 23
- ♦ “Defining Notification Handling” on page 24
- ♦ “Defining the Submit Options” on page 26
- ♦ “Defining the Matching Criteria” on page 28

These are displayed in the [Section 2.2, “Attributes Pane,” on page 50](#).

Identifying the Screen

SecureLogin identifies a login screen for which you want to create an application definition. You can use the **Identify screen** attribute to select or review the login screen selected by the wizard.

Figure 2-8 The Identify Screen

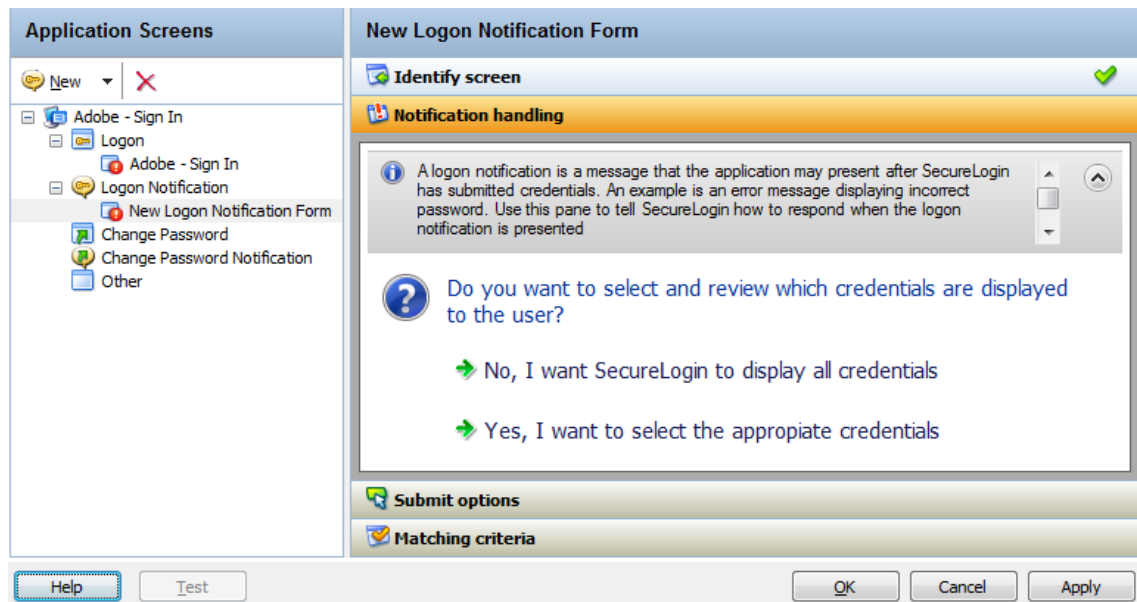

Select the login screen by dragging the **Choose** icon to the login screen or by recording keystrokes.

The title of the login screen is displayed. Click the **Show me** icon to highlight the selection made by the wizard.

Defining Notification Handling

- 1 Through the **Notification handling** menu, specify how SecureLogin must respond when a login notification screen is displayed.

- 2 Click **No, I want SecureLogin to display all credentials** to prompt the users to enter their credentials again. SecureLogin uses the notification from the application.

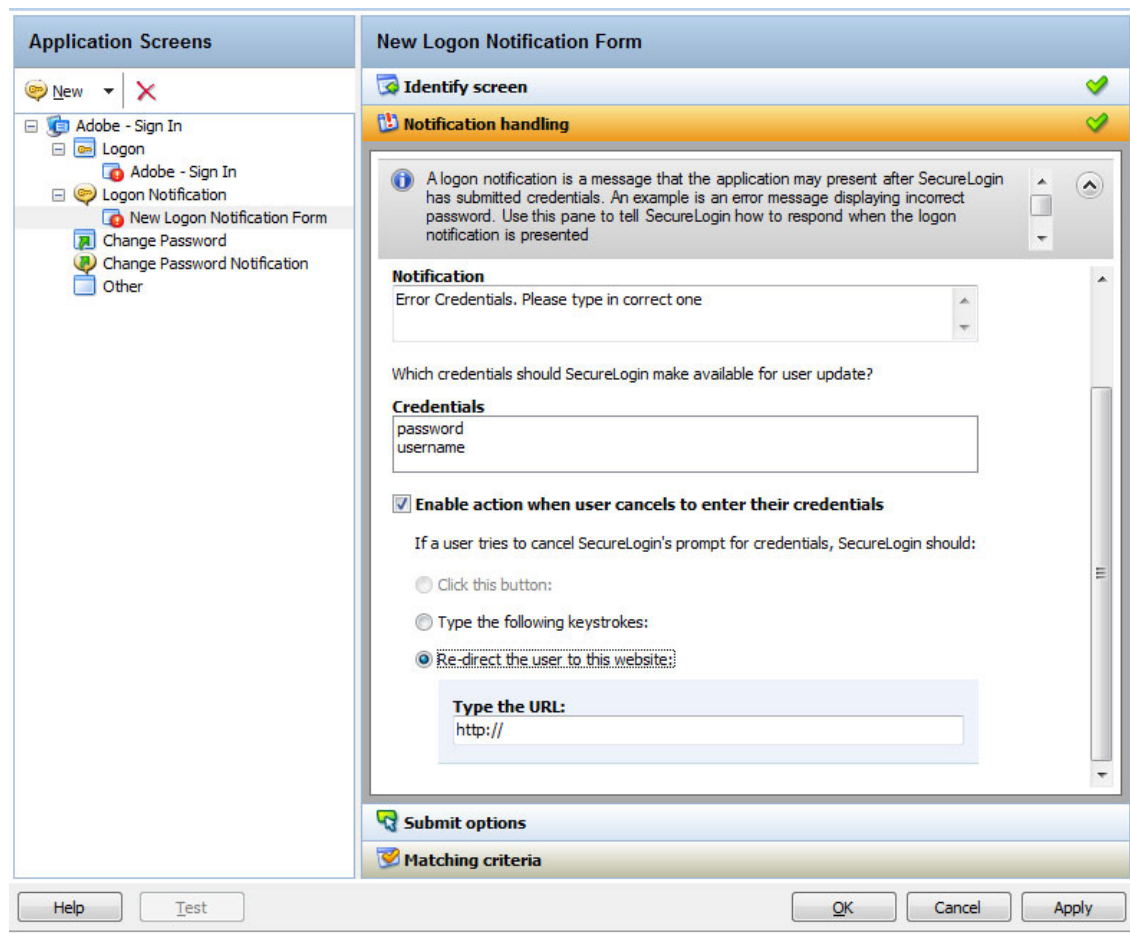

- 3 Click **Yes, I want to select the appropriate credentials** to select the credentials to display to the user for updating. If you select this option, you must specify the prompt displayed to the users. You can select an existing prompt, or you can specify a customized prompt and error message. You must also specify the credential that users provide for the application.

The screenshot shows the 'New Logon Notification Form' dialog. The left pane, titled 'Application Screens', contains a tree view with the following items: 'New', 'Adobe - Sign In', 'Logon', 'Adobe - Sign In', 'Logon Notification', 'New Logon Notification Form' (selected), 'Change Password', 'Change Password Notification', and 'Other'. The right pane, titled 'New Logon Notification Form', has a tabbed interface with the following sections:

- Identify screen**: A green checkmark icon.
- Notification handling**: A yellow header bar with a green checkmark icon. Below it, a text box contains the following text: 'A logon notification is a message that the application may present after SecureLogin has submitted credentials. An example is an error message displaying incorrect password. Use this pane to tell SecureLogin how to respond when the logon notification is presented'.
- Select credentials and review prompt displayed to user**: A section with a checkbox labeled 'Customize credentials and prompt which are displayed to the user.' which is checked. Below it, a text box contains the text 'Error Credentials. Please type in correct one'. Below that, a text box contains the text 'Which credentials should SecureLogin make available for user update?'. Below that, a text box contains the text 'password' and 'username'. Below that, a checkbox labeled 'Enable action when user cancels to enter their credentials' is unchecked.
- Submit options**: A blue header bar.
- Matching criteria**: A yellow header bar.

The bottom of the dialog has buttons for 'Help', 'Test', 'OK', 'Cancel', and 'Apply'.

- 4 If you select **Enable action when user cancels to enter their credentials**, specify the action that SecureLogin must take when a user cancels credential entry.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user cancels the prompt for credentials. Select and highlight the button by dragging the **Choose** icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters when a user cancels the prompt for credentials. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

Defining the Submit Options

- 1 Use the **Submit options** menu to define how SecureLogin submits the login notification screen.
- 2 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the login screen.

How is the logon notification screen submitted?

- ➔ The user submits the screen
- ➔ SecureLogin submits the screen
Actions to be taken to complete the notification

- 3 If you select **SecureLogin submits the screen**, specify the action that SecureLogin takes to submit the logon notification screen.

The screenshot shows the 'Application Screens' pane on the left with a tree view containing: Adobe - Sign In, Logon, Adobe - Sign In, Logon Notification, New Logon Notification Form (selected), Change Password, Change Password Notification, and Other. The main pane is titled 'New Logon Notification Form' and contains several sections:

- Identify screen**: Includes a green checkmark icon.
- Notification handling**: Includes a green checkmark icon.
- Submit options**: Includes a green checkmark icon.
- Actions to be taken to complete the notification**:
 - ☒ SecureLogin submits the logon notification screen
 - How should SecureLogin submit this screen?**
 - ☐ Click this button:
 - ☒ Type the following keystrokes:

Keystrokes recorded:
 - ☐ Re-direct the user to this website:
- Matching criteria**: (Section header visible)

At the bottom of the wizard are buttons for 'Help', 'Test', 'OK', 'Cancel', and 'Apply'.

You can specify one of the following actions:

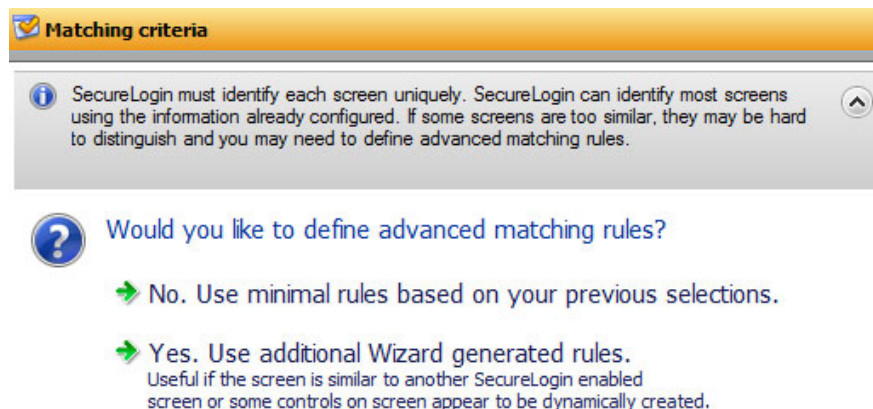

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login notification screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user submits the login notification screen.

Defining the Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

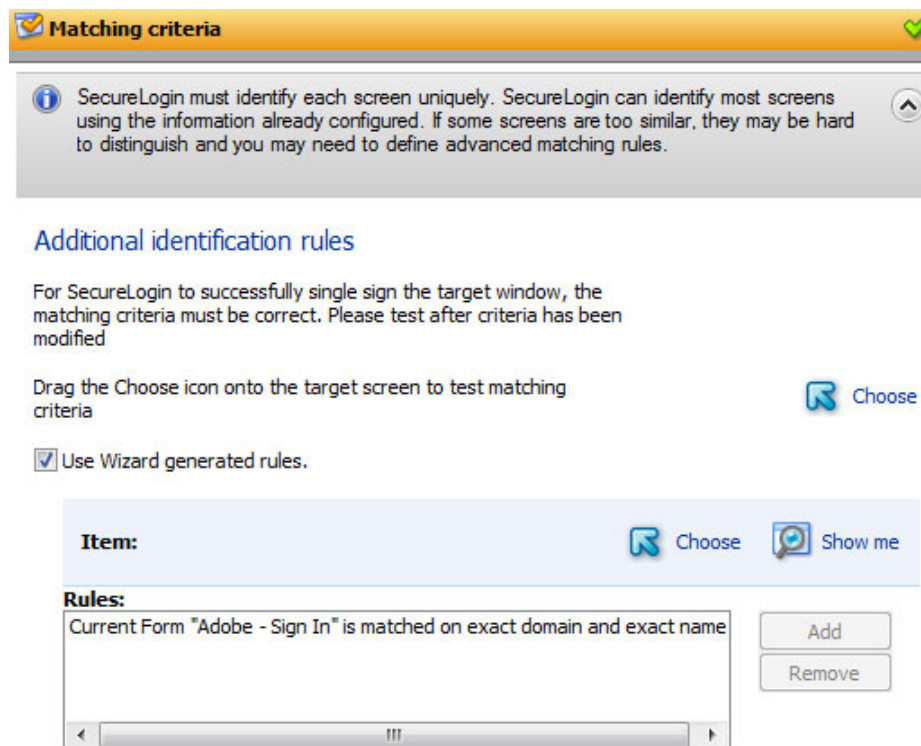

If you select **Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule. After you have selected this option, the following screen appears:

Figure 2-9 Setting the Matching Criteria

If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous menus to identify and handle an application.

Figure 2-10 Defining Additional Rules

By default, **Use Wizard generated rules** is selected. **Rules** lists the controls detected by SecureLogin. You can add a new rule by dragging the **Choose** icon to a specific control. Click **Show me** to confirm that SecureLogin has identified the correct control.

To delete a rule, select the rule, then click **Remove**.

2.1.3 Change Password

You can use the **Change Password** menu of the Application Definitions Wizard to create an application definition to include instructions for changing the password for an application.

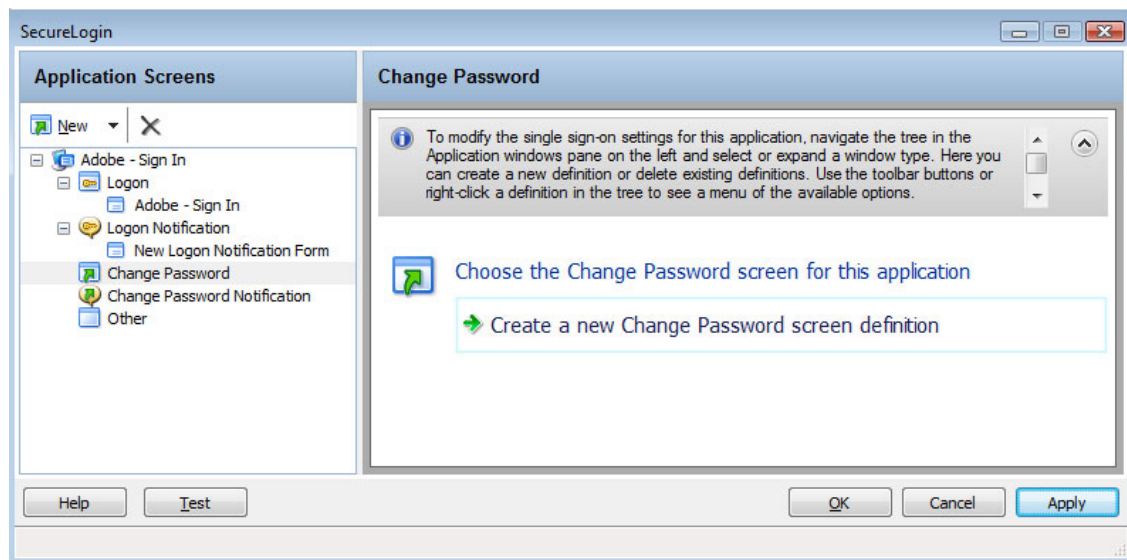

You can allow SecureLogin to generate new passwords that match your password policies or let users choose their passwords. You can also customize the change password prompts displayed to the users.

To define an application definition for changing passwords, complete the following tasks:

- ♦ “Identifying the Change Password Screen” on page 29
- ♦ “Identifying the Change Password Fields” on page 30
- ♦ “Generating Password” on page 31
- ♦ “Selecting a Password Policy” on page 31
- ♦ “Defining the Submit Options” on page 35
- ♦ “Defining the Matching Criteria” on page 37

Identifying the Change Password Screen

In the Application Screens pane of the wizard, click **Create a Change Password screen definition** to create an application definition for changing a password.

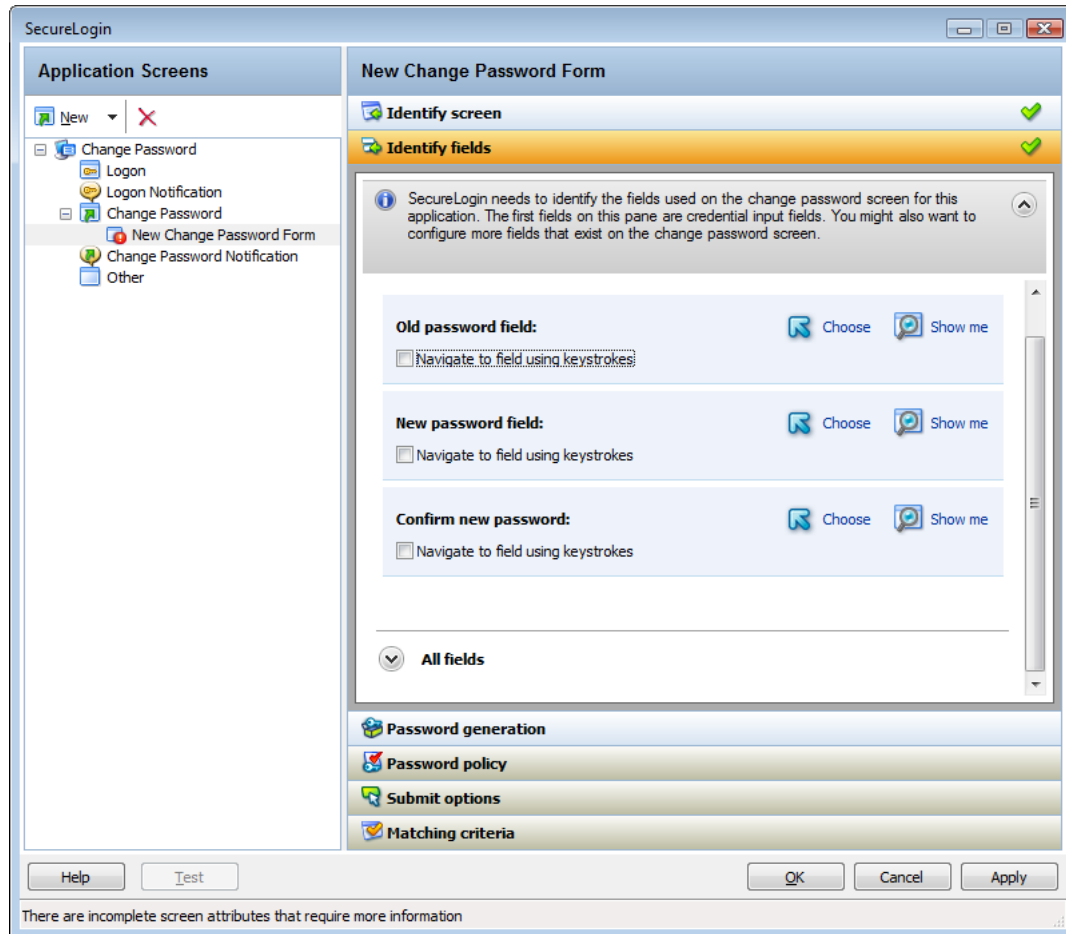

Identifying the Change Password Fields

Through the **Identify Fields** menu, select or change the selection of fields for changing a password. Depending on the application, there might be one or more fields.

If the label text for a particular control is empty or incorrect;

- 1 Click **Show me** to verify if the selected control is correct.
- 2 If **Show me** does not highlight the correct control, use the **Choose** icon to drag and drop to identify the correct control. If an application is built without ordering the labels in accordance with the controls, the **Choose** icon does not update the label.

Alternatively, you can use the **Navigate to field using keystrokes** to select the correct fields. To record keystrokes:

- 2a Click **Start**.
- 2b Specify the keystrokes.
- 2c After you have recorded the keystrokes, click **Close**.

If necessary you can also define the other fields on the screen. You can define how SecureLogin handles the any radio buttons or edit boxes displayed on the **Identify fields** screen.

Generating Password

SecureLogin can generate a random password or you can allow users to specify a new password.

Figure 2-11 The Password Generation Options

- 1 If you select **SecureLogin generates and enters random password**, SecureLogin generates a random password.
- 2 If you select **The user chooses a new password**, specify how to manage the password generation. SecureLogin prompts the user to for a new password. You must specify the prompt that is displayed to the user.

- ☒ The user chooses a new password
- SecureLogin will present a prompt asking for the new password.
Please type the prompt message here

Prompt:

Specify a new password.

Selecting a Password Policy

- 1 Use the **Password Policy** menu to apply a password policy to an application. You can create a new policy or apply an existing password policy.

- 2 If you select **No. Do not configure a password policy for this application**, SecureLogin does not validate the password specified by the user.
- 3 Select **Yes. Let me specify the password rules** to define any or all of the following options:
 - ♦ **Create a New Password Policy:** Creates a new password policy.
 1. In the **Password policy** field, specify a name for the policy.
 2. Specify the rules for the policy.

See [Table 2-1](#) for information about setting the password policy rules.
 - ♦ **Select an Existing Policy:** If you have previously configured a password policy, select the policy in the **Password Policy** drop-down list.
 - ♦ **Enforce Password History:** Select this option to stop users from reusing a previous password. You can specify the number of previous passwords that must not be used.

Table 2-1 Setting Password Policy

Rule	Value to Be Provided	Description
Minimum length	Whole number	Defines the minimum length of the password; that is, the number of characters required for the password.
Maximum length	Whole number	Defines the maximum length of the password; that is, the maximum number of characters allowed in password.
Minimum punctuation characters	Punctuation characters	Defines the minimum number of punctuation characters allowed in a password. Value to be provided should be a whole number.

Rule	Value to Be Provided	Description
Maximum punctuation characters	Punctuation characters	Defines the maximum number of punctuation characters allowed in a password. Value to be provided should be a whole number.
Minimum uppercase characters	Whole number	Defines the minimum number of uppercase characters allowed in a password.
Maximum uppercase characters	Whole number	Defines the maximum number of uppercase characters allowed in a password.
Minimum lowercase characters	Whole number	Defines the minimum number of lowercase characters allowed in a password.
Maximum lowercase characters	Whole number	Defines the maximum number of lowercase characters allowed in a password.
Minimum numeric characters	Whole number	Defines the minimum number of numeric characters allowed in a password.
Maximum numeric characters	Whole number	Defines the maximum number of numeric characters allowed in a password.
Disallow repeat characters	No/Yes/Yes, case insensitive	<p>Disallows the use of repeated characters, or the use of the same character in succession.</p> <p>If this option is set to No, characters can be repeated. This is the default value.</p> <p>If this option is set to Yes, the same alphabetic characters in a different case are considered as different characters. For example, A and a are different.</p> <p>If this option is set to Yes, case insensitive, the successive use of the same alphabetic characters in a different case is not allowed.</p>
Disallow duplicate characters	No/Yes/Yes, case insensitive	No/Yes/Yes, case insensitive
Disallow sequential characters	No/Yes/Yes, case insensitive	<p>Disallows the use of successive characters in alphabetical order.</p> <p>If this option is set to No, sequential characters are allowed. This is the default value.</p> <p>If this option is set to Yes, sequential characters in a different case are considered as non-sequential. For example, a and B are non-sequential.</p> <p>If this option is set to Yes, case insensitive, sequential characters in different cases are disallowed.</p>

Rule	Value to Be Provided	Description
Begin with an uppercase character	No/Yes	<p>Enforces the use of an uppercase alphabetic character as the beginning character of a password.</p> <p>The default value is No.</p> <p>If this option is set to Yes, all other policies that indicate that a password must begin with a particular character or in a specific manner are disabled.</p> <p>IMPORTANT: Only one type of character can be designated as the first value of a password.</p>
End with an uppercase character	No/Yes	<p>Enforces the use of an uppercase letter at the end of a password.</p> <p>The default value is No.</p> <p>If this option is set to Yes, all other policies that indicate that a password must end with a particular character or in a specific manner are disabled.</p>
Prohibited characters	Keyboard characters	<p>Defines a list of characters that cannot be used in a password.</p> <p>NOTE: There is no need of a separator in the list of prohibited characters. For example, @#\$%&*</p>
Begin with any Alpha character	No/Yes	<p>Enforces the use of an alphabetic character at the beginning of a password.</p> <p>The default value is No.</p> <p>If this option is set to Yes, it automatically disables all other policies that specify what the first character of the password should be.</p>
Begin with any number	No/Yes	<p>Enforces the use of a numeric character as the first character of the password.</p> <p>The default value is No.</p> <p>If this option is set to Yes, it automatically disables all other policies that specify what the first character of the password should be.</p>
Begin with any symbol	No/Yes	<p>Enforces the use of a symbol character as the first character of the password.</p> <p>The default value is No.</p> <p>If this option is set to Yes, it automatically disables all other policies that specify what the first character of the password should be.</p>

Rule	Value to Be Provided	Description
End with any Alpha character	No/Yes	Enforces the use of an alphabetic character as the last character of the password. The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the password should end with.
End with any number	No/Yes	Enforces the use of a numeric character as the last character of the password. The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the password should end with.
End with any symbol	No/Yes	Enforces the use of a symbol character as the last character of the password. The default value is No . If this option is set to Yes , it automatically disables all other policies that specify what the password should end with.

Defining the Submit Options

- 1 Use the **Submit options** menu to define how SecureLogin submits the change password screen.

-  **How is the logon screen submitted?**
-  **The user submits the screen**
 -  **SecureLogin submits the screen**
Configure SecureLogin to click button or type keystrokes.

- 1 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the screen.
- 2 If you select **SecureLogin submits the screen**, specify the action that SecureLogin must take to submit the screen.

Login actions

☒ SecureLogin submits the logon screen

How should SecureLogin submit this screen?

☐ Click this button:

☒ Type the following keystrokes:

Keystrokes recorded:

<enter>

Start

☐ Enable action when user cancels to enter their credentials

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the change password screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the change password screen.

To record keystrokes:

1. Click **Start**.
2. Specify the keystrokes.
3. After you have recorded the keystrokes, click **Close**.

- ♦ **Re-direct users to this website:** Specify a URL to go to after users submit the change password screen.

You can also specify the SecureLogin action when users cancel saving their credentials. For this, select **Enable action when user cancels to change their password**. You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login screen.

To record keystrokes:

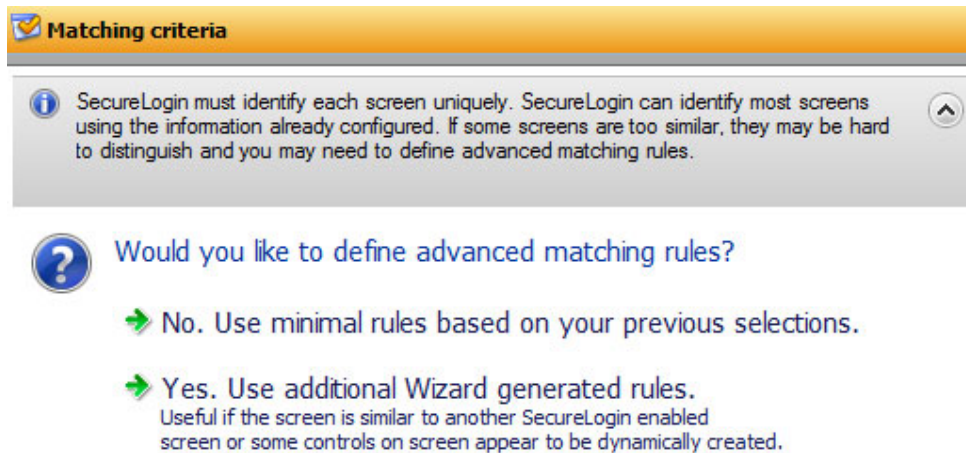

1. Click **Start**.
2. Specify the keystrokes.
3. After you have recorded the keystrokes, click **Close**.

Re-direct users to this website: Specify a URL to go to when users cancel the change password prompt.

Defining the Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

Figure 2-12 Setting the Matching Criteria

- 1 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle changing a password.
- 2 If you select **Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule.
- 3 By default, **Use Wizard generated rules** is selected. The **Rules** text box lists the controls that are detected by SecureLogin. You can add new rule by dragging the **Choose** icon to a specific control and clicking **Show me** to confirm that SecureLogin has identified the correct control.

2.1.4 Change Password Notification

A change password notification is a message that an application displays after the user submits the new password. This might be either a confirmation or error message.

IMPORTANT: A change password notification cannot be created if a change password form is not defined.

The change password notification lets users know whether the password is successfully changed. If a change password notification is not defined, SecureLogin prompts the user to verify if the password is changed successfully.

To handle change password notifications, You must complete the following tasks:

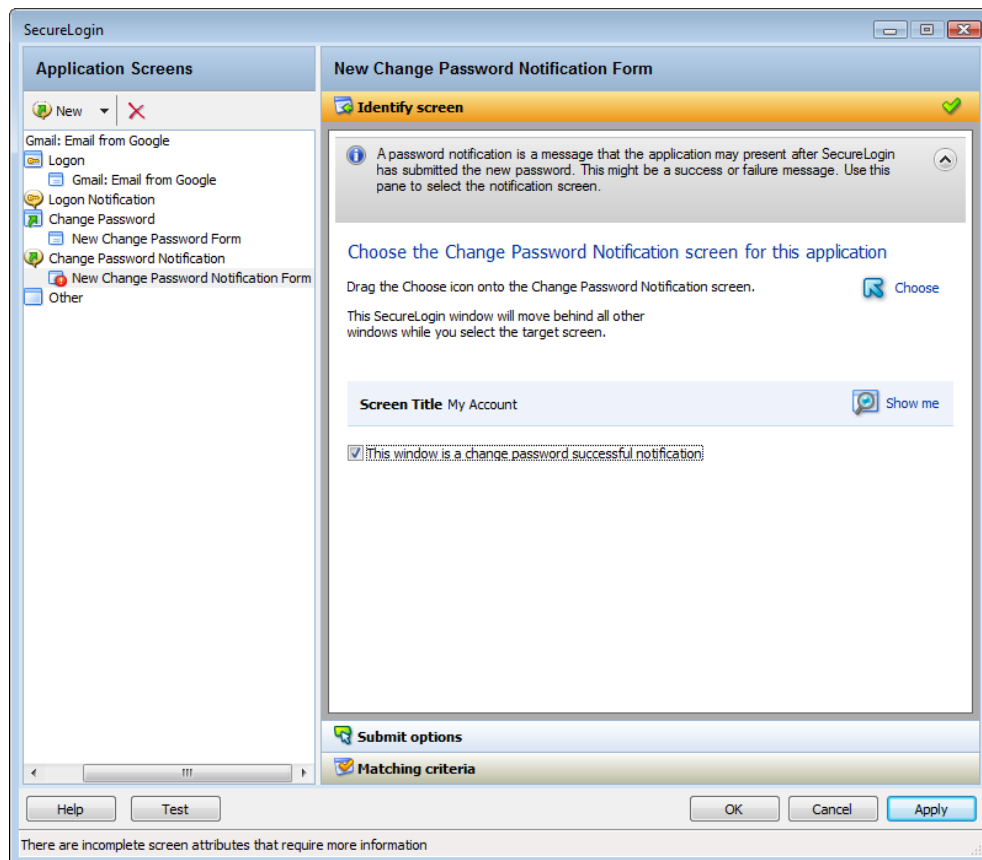

- ♦ “Identifying the Screens” on page 38
- ♦ “Defining the Submit Options” on page 39

- ♦ [“Handling Errors” on page 41](#)
- ♦ [“Defining Matching Criteria” on page 43](#)

Identifying the Screens

SecureLogin must uniquely identify the change password notification screen to handle the notification. You can the **Identify screen** attribute to select or change the notification screen.

Figure 2-13 The Change Password Notification Screen

- 1 Select the Change Password Notification screen by dragging the **Choose** icon to the screen. The title of the screen is displayed.
- 2 Click the **Show me** icon to highlight the selection made by the wizard.
- 3 If you select **This window is a change password successful notification**, you must next define the submit options. See [“Defining the Submit Options” on page 39](#).
- 4 If you do not select **This window is a change password successful notification**, define [“Handling Errors” on page 41](#).

SecureLogin updates the credentials for the application immediately after a password is changed successfully. It does it either automatically or by asking the user.

Defining the Submit Options

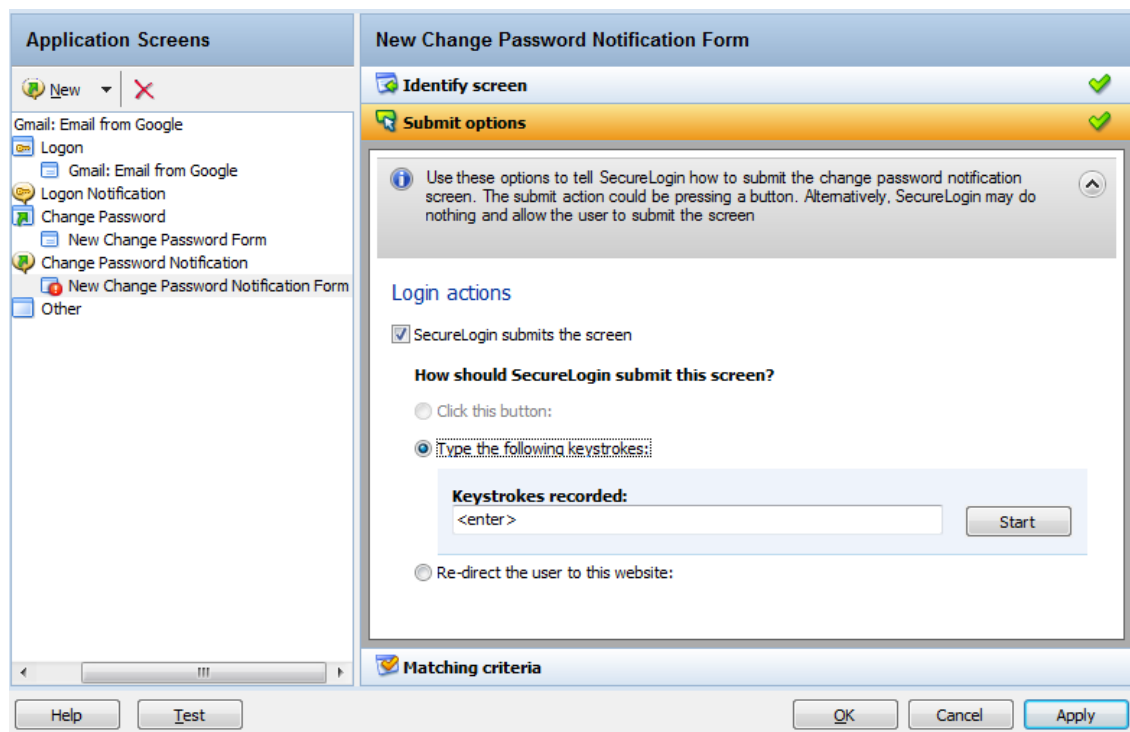

- 1 Use the **Submit options** to define what to do when the change password notification is displayed.

How is the logon screen submitted?

- ➔ The user submits the screen
- ➔ SecureLogin submits the screen
Configure SecureLogin to click button or type keystrokes.

- 2 Select **The user submits the screen** to allow users to handle any change password notification screens.
- 3 If you select **SecureLogin submits the screen**, specify what SecureLogin must do to handle a change password notification screen.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login screen.

To record keystrokes:

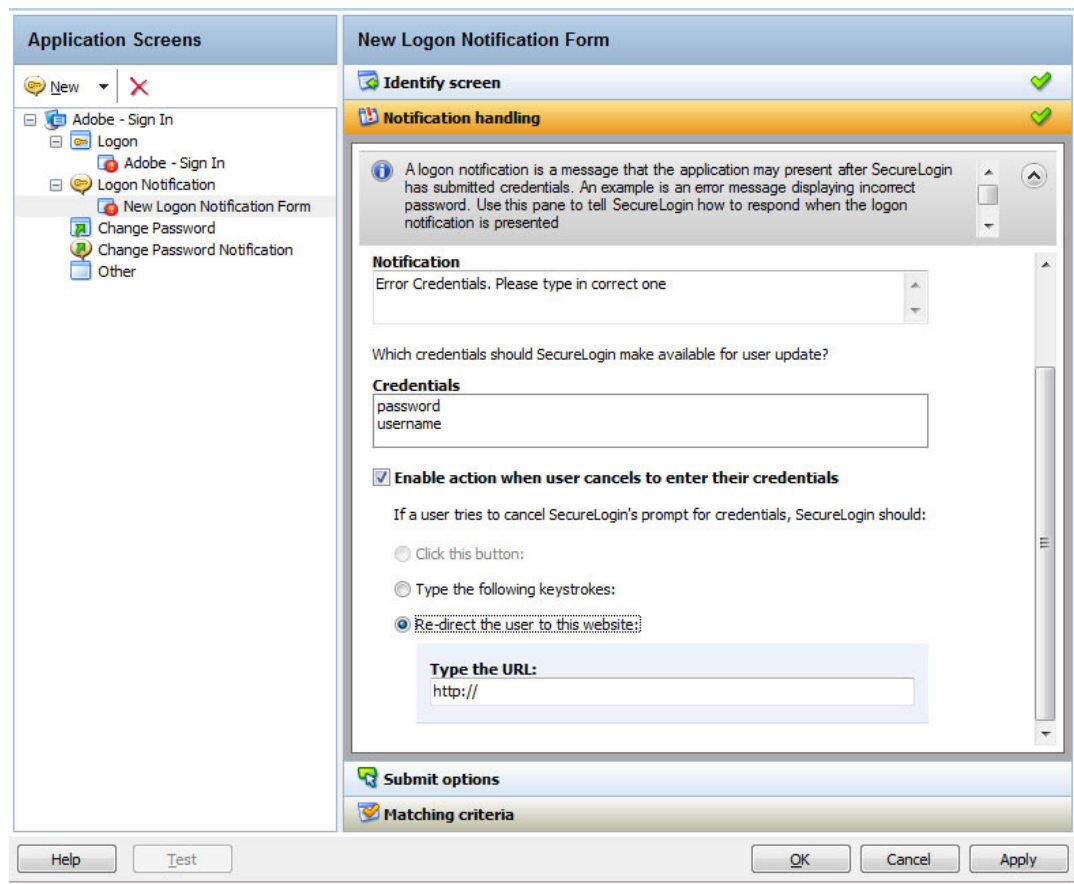

1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

NOTE: If the label text for the control is empty or incorrect:

- ♦ Click **Show me** to check if the selected control is correct.
- ♦ If **Show me** does not highlight the expected control, update it by using the **Choose** icon or by using the **Type the following keystrokes** option.

The **Choose** icon might not update the label if the application is built without ordering labels in accordance with controls.

-
- ♦ **Enable action when user cancels to enter their credentials:** If you select this option, specify what action SecureLogin takes when a user cancels credential entry.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a cancels the prompt for credentials. Select and highlight the button by dragging the **Choose** icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters when the user cancels the prompt for credentials.
To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

Handling Errors

If a change password notification screen does not confirm a password change, you must define rules for SecureLogin to handle the notification.

Figure 2-14 The Change Password Notification Screen

- 1 If you select **Nothing. Allow user to manage the response**, it displays the notification from the application. Users can manage the response.
- 2 If you select **Dismiss the notification following configured rules**, define the action that SecureLogin must take.

You can do any of the following:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login screen.

To record keystrokes:

1. Click **Start**.
2. Specify the keystrokes.
3. After you have recorded the keystrokes, click **Close**.

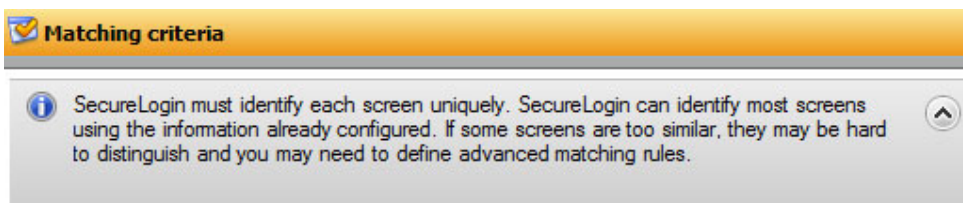

- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

In the **Custom Message** text field, specify a custom message to be displayed to the users.

Defining Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

Figure 2-15 Setting the Matching Criteria

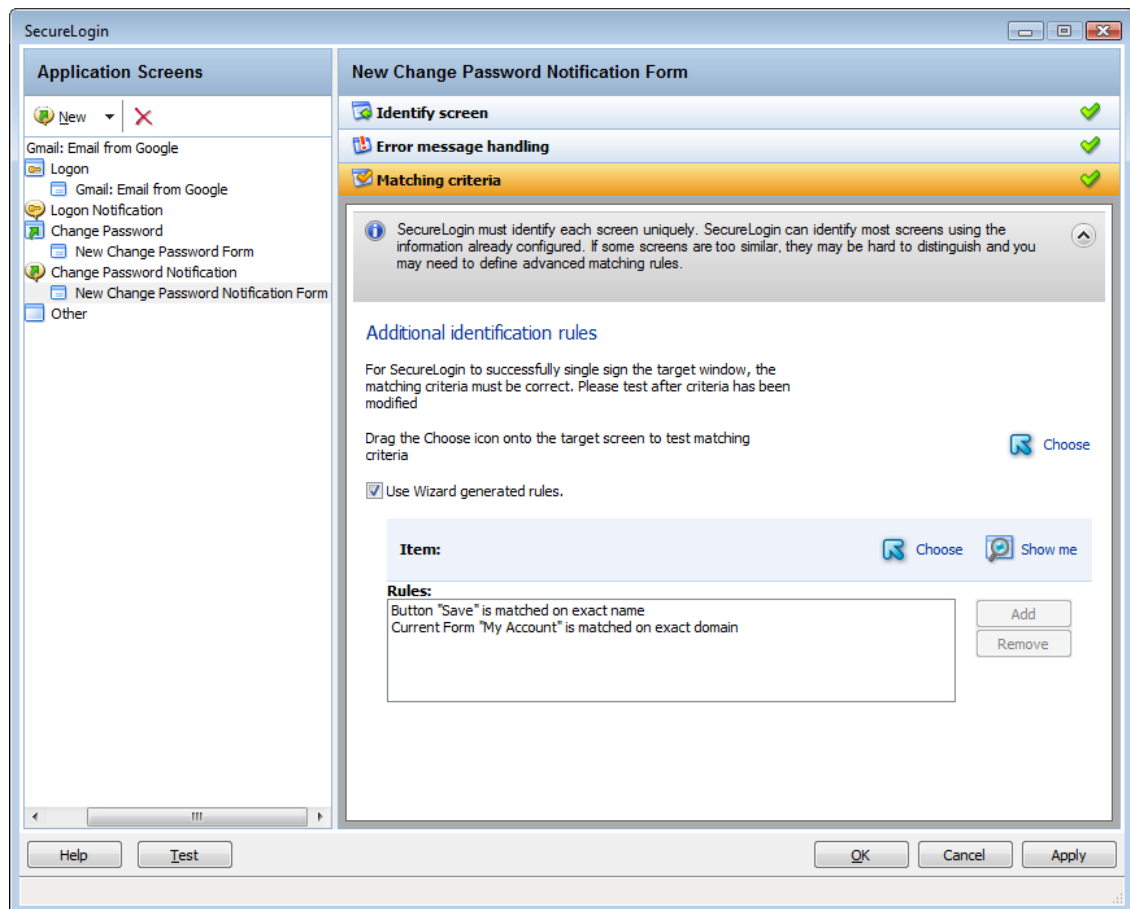

Would you like to define advanced matching rules?

➔ No. Use minimal rules based on your previous selections.

➔ Yes. Use additional Wizard generated rules.
Useful if the screen is similar to another SecureLogin enabled screen or some controls on screen appear to be dynamically created.

- 1 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle an application.
- 2 If you select **Yes. Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule. After you have selected this option, the following screen appears:

By default, **Use Wizard generated rules** is selected. The **Rules** text box lists the controls detected by SecureLogin. You can add a new rule by dragging the **Choose** icon to a specific control and clicking **Show me** to confirm that SecureLogin has identified the correct control.

To modify a rule for a control:

- 1 Select the rule you want to edit, then click **Configure more detailed match for this control**.

2 Define what SecureLogin must match. You can set the following matching rule:

SecureLogin is to match value displayed: If you select this option, SecureLogin only matches those screens that exactly match the displayed text and rules identified.

To test a regular expression: Click **Test Match** to verify if your regular expression is correct. If a regular expression does not match any control on the application screen, SecureLogin prompts you to verify your regular expression and select the correct control.

To delete a rule: Select the rule, then click **Remove**.

2.1.5 Other

Use **Other** menu to define rules for the application definition to handle any other application screens, such as splash screens, automating menu navigation, or redirecting users to a Web site. To handle such screens, You must complete the following tasks:

- ♦ “Identifying the Screen” on page 46
- ♦ “Identifying the Fields” on page 46
- ♦ “Defining the Submit Options” on page 47
- ♦ “Defining Matching Criteria” on page 49

Identifying the Screen

SecureLogin identifies a login screen for which you want to create an application definition.

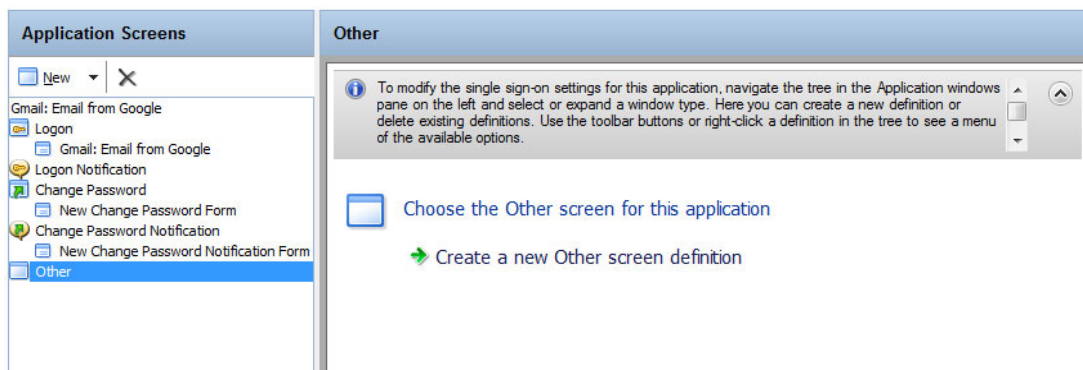

- 1 You can use the **Identify screen** attribute to select or review the login screen selected by the wizard.
- 2 Select the login screen by dragging the **Choose** icon to the login screen or by recording keystrokes. The title of the login screen is displayed.
- 3 Click the **Show me** icon to highlight the selection made by the wizard.

Identifying the Fields

By default, SecureLogin does not select any fields on the screen. You must define the selection.

NOTE: If the screen you have selected does not contain any controls, **Identify fields** is automatically selected.

Figure 2-16 Selecting a Screen

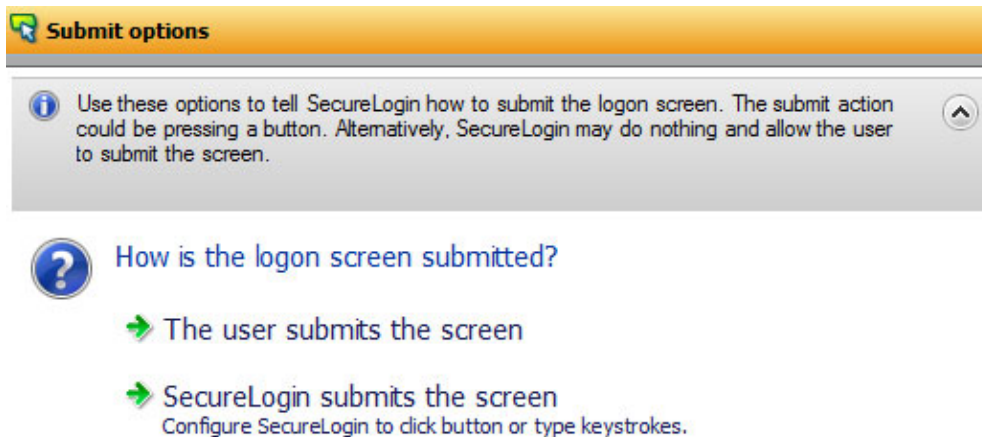

- 1 After selecting a screen, define what SecureLogin must do when it detects any fields on the screen.

- 2 If you select **No. I want to configure only the submit action**, define only the submit options. Continue with [“Defining the Submit Options” on page 47](#) to define the submit options.
- 3 If you select **Yes, I want to select and configure fields**, then you must identify the controls you want SecureLogin to handle and the actions it should take. The actions that can be taken depend on the control types that are identified.

Defining the Submit Options

- 1 Use the **Submit option** menu to define how SecureLogin must submit the login screen.

- 2 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the login screen.
- 3 If you select **SecureLogin submits the screen**, specify the action that SecureLogin must take to submit the login screen.

You can specify one of the following actions:

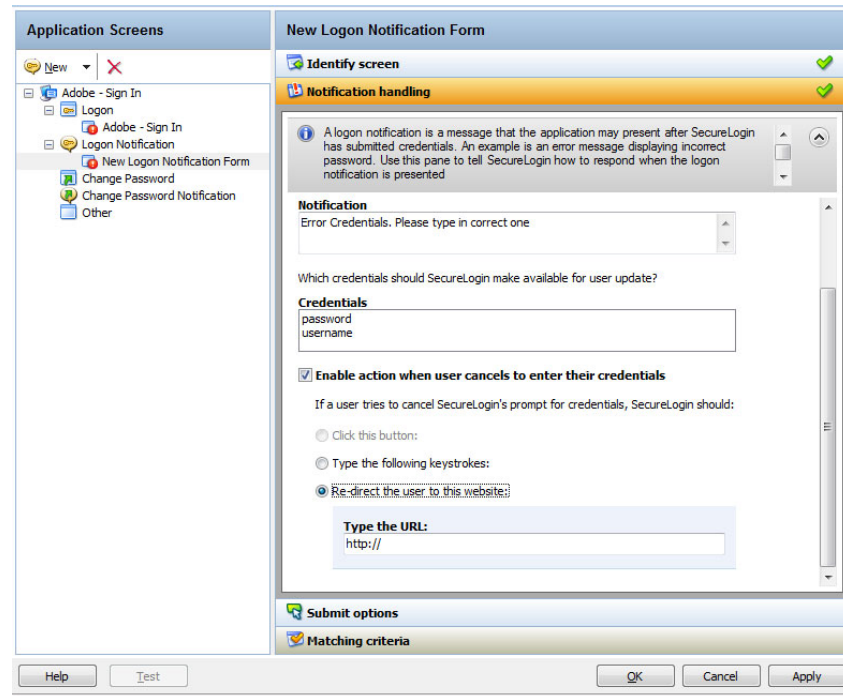

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.
- ♦ **Enable action when user cancels to enter their credentials:** If you select **Enable action when user cancels to enter their credentials**, specify what action SecureLogin takes when a user cancels to enter their credentials.

Figure 2-17 Defining Action When User Cancels Prompt for Credentials

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a cancels the prompt for credentials. Select and highlight the button by dragging the **Choose** icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enter when user cancels the prompt for credentials. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

If you select this option, you must also specify the action SecureLogin when users cancel when prompted to save their credentials. You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select and highlight the button by dragging the **Choose** icon and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes that SecureLogin enters to submit the login screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.

- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

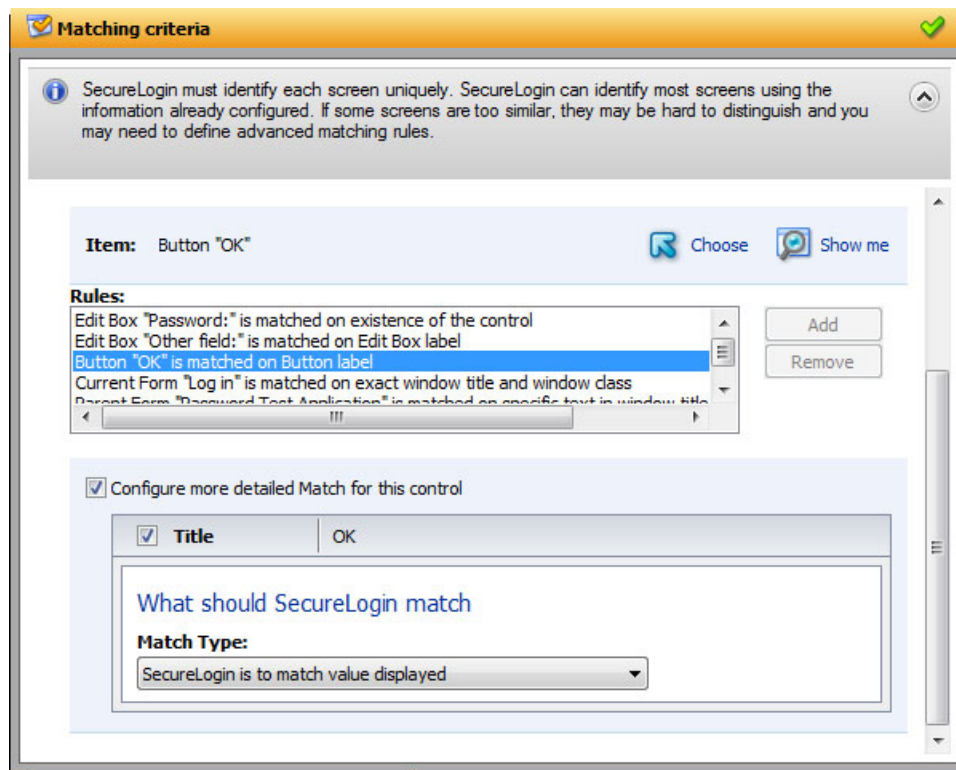

Defining Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

- 1 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle an application.
- 2 If you select **Yes. Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule. After you have selected this option, the following screen appears:
- 3 By default, **Use Wizard generated rules** is selected. The **Rules** text box lists the controls that are detected by SecureLogin. You can add new rule by dragging the **Choose** icon to a specific control and clicking **Show me** to confirm that SecureLogin has identified the correct control.

To modify a rule for a control:

- 3a Select the rule you want to edit, then click **Configure more detailed match for this control**.

- 3b Define what SecureLogin must match. You can set one of the following matching rules:

- ♦ **SecureLogin is to match value displayed:** If you select this option, SecureLogin only matches those screens that exactly match the displayed text and rules identified.

If **Name** is available, it is selected by default. If it is not available and **ID** is available, then **ID** is selected for matching by default.

- ♦ **SecureLogin is to match specific part of the identified ctrl:** If you select this option, you must use a regular expression to define and match the screen features. You cannot use special characters in a regular expression.

3c Click **Test Match** to verify if your regular expression is correct.

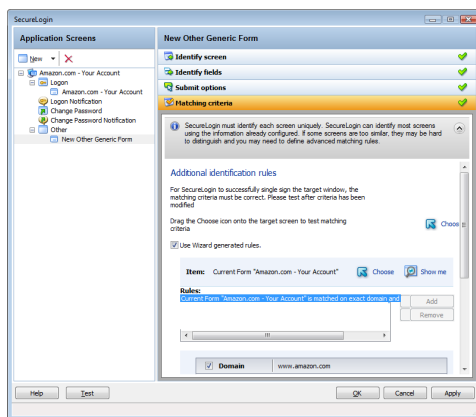

If a regular expression does not match any control on the application screen, SecureLogin prompts you to verify your regular expression and select the correct control.

To delete a rule, select the rule, then click **Remove**.

2.2 Attributes Pane

The Attributes pane is displayed on the right side of the Application Definition Wizard interface. The attributes of the application definition for the selected screen are detailed in the Attributes pane. The attributes displayed are in relation to the selections made in the **Application Screens** pane.

Figure 2-18 The Attributes Pane

If the Application Definition Wizard opens automatically after detecting a login screen, it opens the **Credential Source** menu. Otherwise, it opens the **Identify screen** menu.

When you are building an application definition, the **Attributes** pane can be opened in a top-to-bottom order. You must complete each menu. After you successfully complete each menu, it is marked with a check mark .

Each menu in the **Attribute** pane has a description of the menu item. If you have not completed a menu, you are prompted to complete it before continuing to the next menu item.

2.3 General Controls and Messages

The General controls and messages are located at the end of the Application Definition Wizard page.

Clicking **Test**, **OK**, or **Apply** synchronizes your data and saves it to the directory.

- ♦ [Section 2.3.1, “Help,” on page 51](#)
- ♦ [Section 2.3.2, “Test,” on page 51](#)
- ♦ [Section 2.3.3, “OK,” on page 51](#)

- ♦ [Section 2.3.4, “Apply,” on page 51](#)
- ♦ [Section 2.3.5, “Cancel,” on page 51](#)

Figure 2-19 The General Controls and Messages

2.3.1 Help

Click **Help** to launch the help integrated with SecureLogin. Alternatively, you can launch the help file by pressing F1.

2.3.2 Test

After you have created an application definition, click **Test** to test it. You should create and test an application definition by using a test account before distributing it.

For information about testing an application definition, see [Testing Application Definitions](#).

2.3.3 OK

Click **OK** to save the changes made to the application definition and close the wizard.

2.3.4 Apply

Click **Apply** to save the changes you have made to the application definition and leave the wizard open for further editing.

2.3.5 Cancel

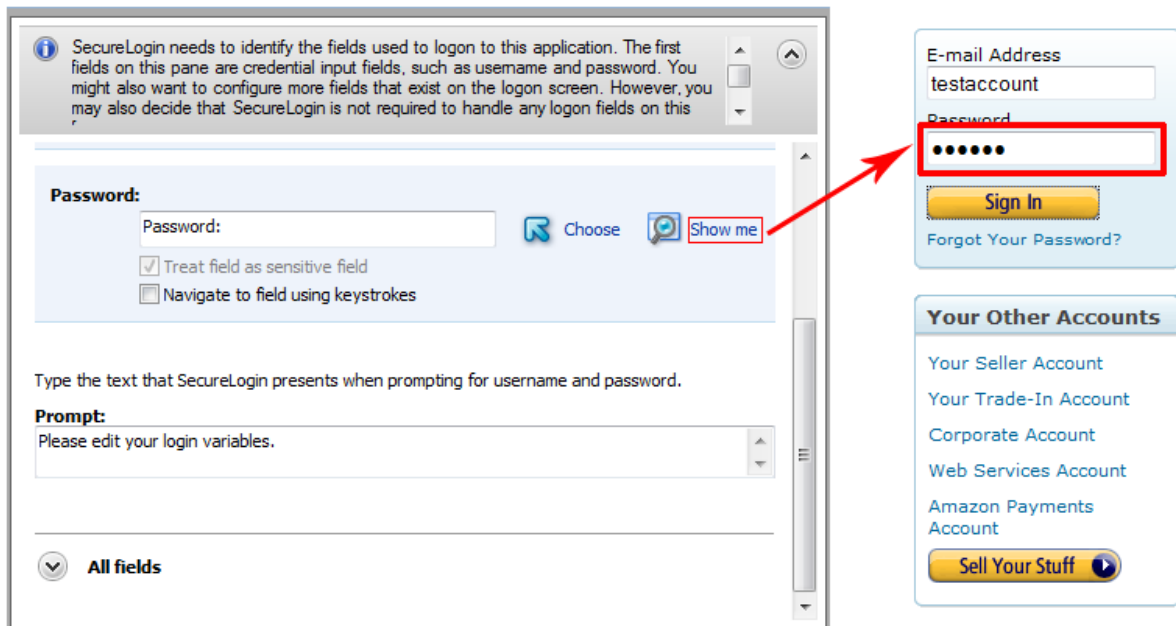

Click **Cancel** to cancel creating or editing the application definition. Clicking **Cancel** closes the Application Definition Wizard without saving any changes you have made. Unsaved changes are lost.

2.4 Selecting and Identifying Screens and Controls

You can identify the controls of an application by dragging the **Choose**  icon to the fields within the application. The wizard moves behind all the other windows and allows you to choose the correct field.

To confirm if the fields are identified correctly, click **Show me**. It highlights the identified fields.

Figure 2-20 Identifying the Control

SecureLogin detects most standard user interface elements. If an application uses a non-standard framework, the Application Definition Wizard does not select or highlight the controls.

For example, the wizard does not detect non-native UI framework such as Gecko, and Qt* but single sign-on can be achieved by manually scripting the application. Similarly, applications such as Mozilla* Thunderbird* 2.0.0.18 and Novell iFolder® cannot be enabled for single sign-on by using the wizards. The wizard fails to detect the control to enable these applications.

For such applications, you must identify the fields by recording keystrokes, as described in [Section 2.5, “Recording Keystrokes,”](#) on page 52.

2.5 Recording Keystrokes

SecureLogin can record keystrokes to facilitate navigation or to enter particular commands, if you cannot identify the controls. If you have difficulty in identifying the controls on the application window then select **Navigate to field** using keystrokes.

IMPORTANT: You cannot record the following keystrokes. They are reserved by Windows.

- ♦ Ctrl + Esc: This posts a journal quit message.
 - ♦ Ctrl + Alt + Del: This posts a journal quit message.
 - ♦ Ctrl + Break: This is part of the journal quit code.
 - ♦ Ctrl + Shift + Esc: This cancels the collection of keystrokes.
-

You cannot type in **Navigate to field by using keystrokes**, because the field displays only recorded keystrokes.

To record keystrokes:

- 1 Click **Start**.
- 2 Specify the keystrokes.
- 3 After you have recorded the keystrokes, click **Close**. The dialog box closes and returns you to the Application Definition Wizard.

If you make a mistake in recording the keystrokes, repeat the procedure.

2.6 Using Regular Expressions

Some dialog boxes in SecureLogin allow you to specify text to identify an application screen. The **SecureLogin needs to match** option allows you to use regular expressions as another way to uniquely identify a particular application screen.

Regular expressions are text patterns that are used for string matching. They contain a mix of plain text and special characters to indicate what kind of matching to do.

If your regular expression does not match any controls on the particular application screen, SecureLogin prompts you to check your regular expression and ensure the correct control is selected. You might need to skip special characters in your regular expression.

You can specify a regular expression such as:

Connecting to server (.*)

The (.) specifies the value that must be captured to define the credentials. You can have one credential set for each regular expression value.

3 Using the Application Definition Wizard

The Application Definition wizard provides a unified and intuitive process that helps you manage different application types.

You use the Application Definition Wizard to define how SecureLogin behaves when you select an application for single sign-on.

The following sections provide information about using the Application Definition Wizard to create application definitions for Web, Windows, and Java applications.

- ♦ [Launching the Application Definition Wizard](#)
- ♦ [Creating an Application Definition for a Web Application](#)
- ♦ [Creating an Application Definition for a Windows Application](#)
- ♦ [Creating an Application Definition for a Java Application or an Oracle Form](#)
- ♦ [Using a Predefined Application Definition](#)
- ♦ [Testing Application Definitions](#)
- ♦ [Deploying Application Definitions](#)
- ♦ [Configuring Notifications](#)

3.1 Launching the Application Definition Wizard

If SecureLogin is active on your workstation and if you have permission to create an application definition, a notification appears in the system tray when you launch an application. This notification notifies that the application is available for single sign-on. When you click on the notification you get the following prompt to enable single sign-on for the application.

Figure 3-1 Prompt to Enable Single Sign-On

Do you want to single sign enable the screen?

- ➔ Yes, I want to single sign using the default selections done by the wizard.
- ➔ Yes, I want to single sign enable the screen using the wizard.
- ➔ Cancel, I do not want to single sign this screen at this time.
- ➔ No, Never prompt me to single sign this screen.

SecureLogin caches the applications that are available for single sign-on and this is indicated with orange color of the SecureLogin icon. If you ignore the notification when the application is launched for the first time then, you can click on the SecureLogin icon and select the required application from the list of available applications for single sign-on.

Typically, the wizard launches when it detects a new login screen. However, you can also create or modify application definitions by using the wizard to automate handling the notification screens. You can do this in one of the following ways:

- ♦ [Section 3.1.1, “Automatically Launching the Wizard,” on page 56](#)
- ♦ [Section 3.1.2, “Launching the Wizard through the Add Application Menu,” on page 56](#)

3.1.1 Automatically Launching the Wizard

If the Wizard option is enabled, SecureLogin automatically prompts you to use the wizard to create an application definition for the application. This is determined by the Wizard mode preference as described in [Chapter 5, “Setting the Wizard Mode Preference,” on page 109](#).

The auto-detection dialog box does not appear if the Application Definition Wizard or the administrative management utilities are open.

3.1.2 Launching the Wizard through the Add Application Menu

- 1 Right-click the SecureLogin icon on the notification area (system tray), then select **Add Application**.
- 2 The Add an Application Definition dialog box appears, prompting you to drag the **Choose**  icon to the application’s login window.
- 3 Select **Cancel, I do not want to create a new definition** if you do not want to modify the existing application definition.

When you launch an application and its application definition already exists then, the Add Application wizard displays the following additional option:

`Cancel, open script editor so I can make changes.`

Selecting this option, closes the wizard and opens the script editor of the application.

3.2 Creating an Application Definition for a Web Application

A web application is an application that runs on a Web browser. You can create an application definition for a Web application by accepting the default selections in the wizard, or you can manually select the attributes required for the application definition.

- ♦ [Section 3.2.1, “Prerequisites,” on page 56](#)
- ♦ [Section 3.2.2, “Using the Default Selections for an Application Definition,” on page 57](#)
- ♦ [Section 3.2.3, “Manually Defining the Attributes for an Application Definition,” on page 58](#)

3.2.1 Prerequisites

- ♦ Close all open SecureLogin prompts.

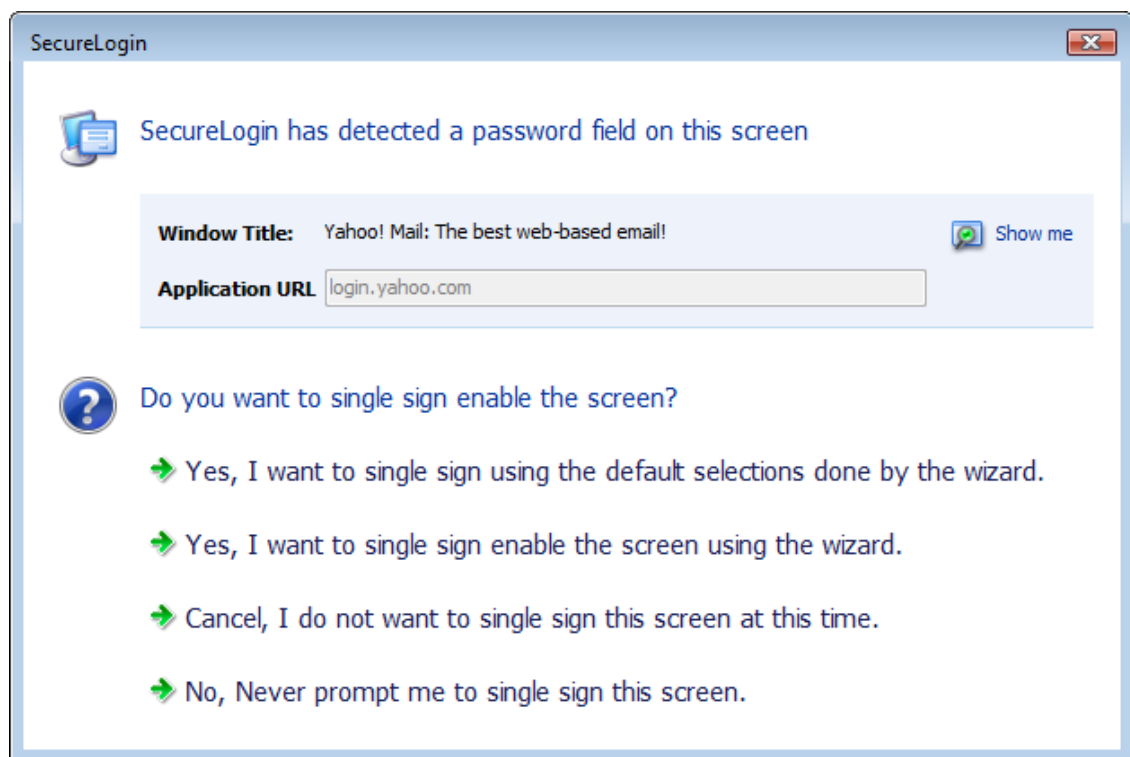

- ♦ Verify if you have permissions to create an application definition. See [Chapter 5, “Setting the Wizard Mode Preference,”](#) on page 109.
- ♦ Ensure that SecureLogin is running on your workstation.

3.2.2 Using the Default Selections for an Application Definition

- 1 Launch the web application for which you want to enable single sign-on.
SecureLogin detects the application and prompts you to enable single sign-on.
- 2 Select **Yes, I want to single sign using the default selections done by the wizard.**
- 3 Specify your credentials, then click **OK.**
SecureLogin saves your credentials in the directory. The next time you launch the application, SecureLogin provides the credentials for you.

Example: Using the Default Selections to Enable Yahoo! Mail for Single Sign-On

- 1 Ensure that you have completed the prerequisites in [Section 3.2.1, “Prerequisites,”](#) on page 56.
- 2 Launch Yahoo!* Mail.
SecureLogin detects the application and prompts you to enable it for single sign-on.

- 3 Select **Yes, I want to single sign using the default selections done by the Wizard.**
- 4 Specify your Yahoo! ID and password.
- 5 Click **OK.**

If you have specified the correct credentials, you are logged in to Yahoo! Mail.
For subsequent logins, SecureLogin provides the credentials and logs in.

3.2.3 Manually Defining the Attributes for an Application Definition

- 1 Ensure that you have completed the prerequisites in [Section 3.2.1, “Prerequisites,”](#) on page 56.
- 2 Launch the Web application for which you want to create an application definition.
SecureLogin detects the application and prompts you to enable the screen for single sign-on.

Do you want to single sign enable the screen?

- ➔ Yes, I want to single sign using the default selections done by the wizard.
- ➔ Yes, I want to single sign enable the screen using the wizard.
- ➔ Cancel, I do not want to single sign this screen at this time.
- ➔ No, Never prompt me to single sign this screen.

- 3 Select **Yes, I want to single sign enable the screen using the wizard.** The Application Definition Wizard page is displayed.
- 4 Configure the following attributes to create an application definition.
 - ♦ [“Identifying the Screens”](#) on page 58
 - ♦ [“Specifying the Credentials Source”](#) on page 58
 - ♦ [“Identifying the Fields”](#) on page 60
 - ♦ [“Specifying Re-authentication Rules”](#) on page 62
 - ♦ [“Defining the Submit Options”](#) on page 63
 - ♦ [“Defining the Matching Criteria”](#) on page 64

Identifying the Screens

Use the **Identify screen** tab to identify the login screen. If the Application Definition Wizard identifies the login screen correctly, a check mark  displays next to **Identify screen**. Click **Show me** to verify if the screen is correctly identified.

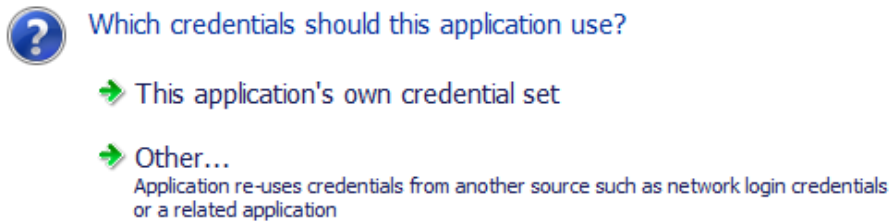

If the screen is not correctly identified, drag the **Choose**  icon to the login screen to select it.

Specifying the Credentials Source

Use the **Credential source** tab to define the source of the credentials for the applications.

Some applications use their own credential set to log in. However, some applications might reuse credentials from another source, such as the user's network password or a one-time password.

Figure 3-2 Specifying the Credential Source

- 1 Select **This application's own credential set** to use the application's credential set to log in. If you select this option, SecureLogin creates a discrete set of credentials to enable the application. The credential set has the name of the application.
- 2 Select **Other** to define another source of credentials. If you select this option, select the source of credentials for the application.

The options for the credential source are:

Where will credentials for this application come from?

- ☒ This application requires other credential source
- ☐ A one-time password from a smartcard
 - ☐ The user's network login credentials
 - ☐ Another SecureLogin enabled application
 - ☐ SecureLogin selects credentials based on a value identified on this screen

- ♦ [“Using a One-Time Password” on page 59](#)
- ♦ [“Using the User’s Network Login Credentials” on page 59](#)
- ♦ [“Using Credentials from Another Single Sign-On-Enabled Application” on page 59](#)
- ♦ [“Selecting Credentials Based on a Value Identified on the Screen” on page 60](#)

Using a One-Time Password

Select **A one-time password from a smart card** to use a one-time password from a smart card.

Using the User’s Network Login Credentials

Select **The user’s network logon credentials** to use the user’s directory credentials to log in.

Using Credentials from Another Single Sign-On-Enabled Application

Select **Another SecureLogin enabled application** to use the credentials of another application enabled for single sign-on. Select the application from a list of available applications enabled for SecureLogin.

Selecting Credentials Based on a Value Identified on the Screen

Select **SecureLogin selects credentials based on a value identified on this screen** to provide the credentials based on the presence of a particular value on the login screen. This option uses a text entry. Regular expressions are supported in the text entry.

For example:

Connecting to server (.*)

where (.*) specifies the value that must be captured to define the credentials.

Identifying the Fields

SecureLogin must identify the fields on the login screen before it can log in to the application. Typically, these are the username and password fields. You can also configure fields such as radio buttons or edit boxes on the login screen. Use the **Identify fields** menu to view the selected field.

Figure 3-3 Selecting or Reviewing the Login Fields

Do you want to select or review logon fields for SecureLogin to handle?

No. SecureLogin is not required to handle the fields on this screen.

Yes. Let me select or review the logon fields.

SecureLogin will need to know more information to do this.

- “Not Allowing SecureLogin to Handle the Fields” on page 60
- “Reviewing the Fields” on page 60
- “Reviewing Other Fields” on page 62

Not Allowing SecureLogin to Handle the Fields

Select **No. SecureLogin is not required to handle the fields on this screen** if you do not want SecureLogin to handle the login fields on the screen.

You can use this option to create a credential set, which can be used with other application screens. Similarly, you can use the credential set to link to other application definitions.

Reviewing the Fields

- 1 Select **Yes. Let me select or review the logon fields** to review the fields selected by the wizard. By default, SecureLogin uses the field names as the prompts in the dialog boxes. You can edit the field names to make them clear and user-friendly.
- 2 If the login fields are not identified correctly, identify them manually by dragging the **Choose** icon to the fields and clicking the **Show me** icon. The selected fields are highlighted.

- 3 If **Show me** does not highlight the correct control, update it by dragging and dropping the **Choose** icon to the button you want.

or

Use the **Navigate to field using the keystrokes** option:

- 3a Click **Start**.
- 3b Specify the keystrokes.
- 3c Select **Close** to return to the **Identify fields** menu.
- 3d Select **Stop** to stop the recording.

The next time you log in to the application, the keystrokes are used to log in.

- 4 Select **Treat text field as a sensitive field** to treat the username field like a password field and disguise the characters with asterisks. This is optional for the username but mandatory for the password.
- 5 (Optional) Specify the text that SecureLogin presents when prompting the user for username and password.

Type the text that SecureLogin presents when prompting for username and password.

Prompt:

Please edit your login variables.

Reviewing Other Fields

Click **All fields** to show other fields detected by the wizard on the login screen. Each control is listed by type and name (if known).

Select the field you want SecureLogin to use in managing the login for the application, then specify the actions for SecureLogin.

All fields

Check each field you would like SecureLogin to include in the login for this application.

<input checked="" type="checkbox"/> EditBox	Yahoo! ID:	Show me
<input checked="" type="checkbox"/> EditBox	Password:	Show me
<input checked="" type="checkbox"/> CheckBox	Keep me signed in for 2 weeks unless I sign out. Info	Show me

What should SecureLogin do with this field?

Action:
Use the value selected below for all users ▼

Select a value for the checkbox:
Unchecked ▼

Depending on the application, any or all of the following fields are displayed.

- ♦ Edit box
- ♦ Check Box
- ♦ Combo Box
- ♦ Radio Button

For information about configuring SecureLogin to use these additional fields, see [All Fields](#).

Specifying Re-authentication Rules

- 1 Use the **Re-authentication** menu to specify if users must re-authenticate with their network credentials or an authentication device.
- 2 If you select **No. The user is not required to re-authenticate**, SecureLogin does not prompt users to re-authenticate before providing credentials to the application.
- 3 If you select **Yes. Enforce re-authentication before accessing this application**, users must specify credentials in order to re-authenticate.
- 4 From the **Select from the methods detected** drop-down list, select the method SecureLogin must use. You can select from:
 - ♦ **Use same Credentials as Network Login:** Use the network login credentials.
 - ♦ **Default:** The method the user used to log in to the application.
 - ♦ **Password:** The network password.

- ♦ **Smart Card:** After the PIN is verified, SecureLogin checks to see if the smart card belongs to the user or not.
- 5 You must also specify the action SecureLogin takes when the users cancels the re-authentication.

You can define one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user cancels the re-authentication dialog box. Select the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters when a user clicks **Cancel** in the re-authentication dialog box. To record keystrokes:
 1. Click **Start**.
 2. Specify the **keystrokes**.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

Defining the Submit Options

- 1 Use the **Submit options** menu to define how SecureLogin submits the login screen.
- 2 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the login screen.

How is the logon notification screen submitted?

The user submits the screen

SecureLogin submits the screen

Actions to be taken to complete the notification

- 3 If you select **SecureLogin submits the screen**, specify the action SecureLogin takes to submit the login screen.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters to submit the login notification screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user submits the login notification screen.

- 4 You can also specify the action SecureLogin uses when users cancel a prompt to save their credentials. For this, select **Enable action when user cancels to change their password**.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters to submit the login screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct users to this website:** Specify a URL to go to when users cancel the change password prompt.

Defining the Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

- 1 Use the **Matching criteria** menu to define the matching criteria.
- 2 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle the application window.
- 3 If you select **Yes. Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule. After you select this option, the following screen appears:
- 4 By default, **Use Wizard generated rules** is selected. The **Rules** text box lists the controls that are detected by SecureLogin. You can add a new rule by dragging the **Choose**  icon to a specific control on the application window and then clicking **Show me** to confirm that SecureLogin has identified the correct control.

To modify a rule for a control:

- 4a Select the rule you want to edit, then click **Configure more detailed match for this control**
- 4b Define what SecureLogin must match. You can set the following matching rule:
 - ♦ **SecureLogin is to match value displayed:** If you select this option, SecureLogin only matches those screens that exactly match the displayed text and rules identified.

*To verify if your regular expression is correct, click **Test Match**.*

If a regular expression does not match any control on the application screen, SecureLogin prompts you to verify your regular expression and select the correct control.

You have successfully completed creating an application definition for a Web application. The next time you launch the application, SecureLogin provides the credentials for you.

3.3 Creating an Application Definition for a Windows Application

A Windows application is any application that is launched with an executable (.exe) file.

You can create an application definition for a Windows application by accepting the default selections in the wizard, or you can manually select the attributes you want.

- [Section 3.3.1, “Prerequisites,” on page 65](#)
- [Section 3.3.2, “Using the Default Selections to Create an Application Definition,” on page 65](#)
- [Section 3.3.3, “Manually Defining the Attributes for an Application Definition,” on page 66](#)

3.3.1 Prerequisites

- Close all open SecureLogin prompts.
- Verify if you have permissions to create application definition. See [Chapter 5, “Setting the Wizard Mode Preference,” on page 109](#).
- Ensure that **Add application prompts for Windows applications** option is selected.
- Ensure that SecureLogin is running on your workstation.

3.3.2 Using the Default Selections to Create an Application Definition

- 1 Start a Windows application for which you want to create an application definition.
SecureLogin detects a login screen and displays the following prompt:

Do you want to single sign enable the screen?

- ➔ Yes, I want to single sign using the default selections done by the wizard.
- ➔ Yes, I want to single sign enable the screen using the wizard.
- ➔ Cancel, I do not want to single sign this screen at this time.
- ➔ No, Never prompt me to single sign this screen.

- 2 Select **Yes, I want to single sign using the default selections done by the wizard**.

SecureLogin identifies the application and displays the name of the application in the prompt.

- 3 You are prompted to specify the credentials for the application. Specify the username, password, and any other information required.

- 4 Click **OK**.

SecureLogin saves your credentials and uses them to log in to the application.

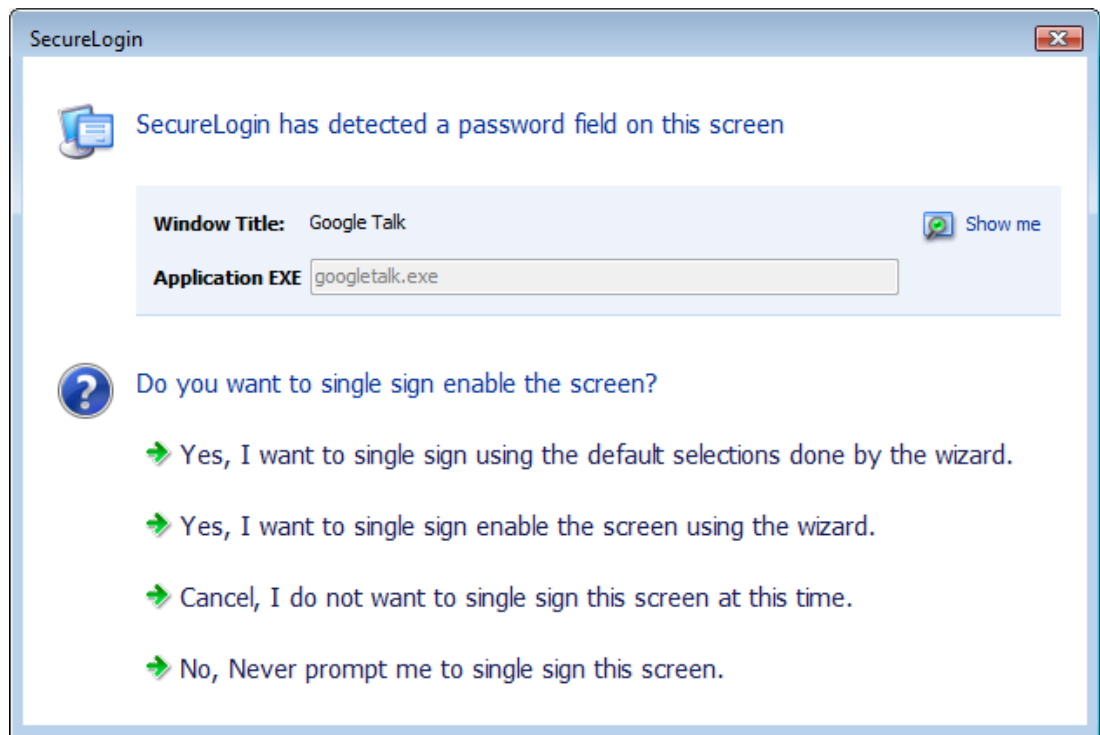

The next time you launch the application, SecureLogin provides your username and password.

Example: Using the Default Selections to Create an Application Definition for Google Talk

The following example demonstrates creating an application definition for Google* Talk*.

This procedure assumes that you already have a Google account.

- 1 Ensure that you have completed the prerequisites in [Section 3.3.1, "Prerequisites,"](#) on page 65.
- 2 Launch Google Talk.
SecureLogin detects the application and the SecureLogin dialog box is displayed.

- 3 Select **I want to single sign the screen using the default selections done by the wizard.**
The Enter your Credentials dialog box is displayed.
- 4 Specify your username and password, then click **OK.**
SecureLogin saves the credentials and uses them to log in to you Google Talk.
- 5 Test the application definition by logging out and logging in again.
If the application is defined correctly with the correct credentials, you are logged in successfully. If your login is not successful, delete the application definition and repeat the above steps. You might also need to review the application definition for event responses and errors.

3.3.3 Manually Defining the Attributes for an Application Definition

- 1 Ensure that you have completed the prerequisites in [Section 3.3.1, "Prerequisites,"](#) on page 65.
- 2 Launch the Windows application for which you want to create an application definition.
SecureLogin detects the application and prompts you to enable the screen for single sign-on.

Do you want to single sign enable the screen?

- ➔ Yes, I want to single sign using the default selections done by the wizard.
- ➔ Yes, I want to single sign enable the screen using the wizard.
- ➔ Cancel, I do not want to single sign this screen at this time.
- ➔ No, Never prompt me to single sign this screen.

- 3 Select **Yes, I want to single sign enable the screen using the wizard**. The Application Definition Wizard page is displayed.
- 4 Configure the following attributes to create an application definition:
 - ♦ “Identifying the Screens” on page 67
 - ♦ “Specifying the Credential Source” on page 68
 - ♦ “Identifying the Fields” on page 69
 - ♦ “Specifying Re-authentication Rules” on page 71
 - ♦ “Defining the Submit Options” on page 71
 - ♦ “Defining the Matching Criteria” on page 72

Identifying the Screens

- 1 Use the **Identify screen** tab to identify the login screen. If the Application Definition Wizard identifies the login screen correctly, a check mark  displays next to **Identify screen**. Click **Show me** to verify if the screen is correctly identified.

Choose the logon screen for this application

Drag the Choose icon onto the logon screen.

This SecureLogin window will move behind all other windows while you select the target screen.

Screen Title Google Talk

- 2 If the screen is not correctly identified, drag the **Choose**  icon to the login screen to select it.

Specifying the Credential Source

- ♦ “Using a One-Time Password” on page 68
- ♦ “Using User’s Network Login Credentials” on page 69

- ♦ [“Using Credentials from Another Single Sign-One Enabled Application” on page 69](#)
- ♦ [“Selecting Credentials Based on a Value Identified on the Screen” on page 69](#)

- 1 Use the **Credential source** tab to define the source of the credentials for the applications.

Some applications use their own credential set to log in. However, some applications might reuse credentials from another source, such as the user's network password or a one-time password.

Which credentials should this application use?

This application's own credential set

Other...

Application re-uses credentials from another source such as network login credentials or a related application

- 2 Select **This application's own credential set** to use the application's credential set to log in. If you select this option, SecureLogin creates a discrete set of credentials to enable the application. The credential set has the name of the application.
- 3 Select **Other** to define another source of credentials. If you select this option, select the source of credentials for the application.

Where will credentials for this application come from?

This application requires other credential source

A one-time password from a smartcard

The user's network login credentials

Another SecureLogin enabled application

SecureLogin selects credentials based on a value identified on this screen

The options for the credential source are:

- ♦ [“Using a One-Time Password” on page 68](#)
- ♦ [“Using User's Network Login Credentials” on page 69](#)
- ♦ [“Using Credentials from Another Single Sign-One Enabled Application” on page 69](#)
- ♦ [“Selecting Credentials Based on a Value Identified on the Screen” on page 69](#)

Using a One-Time Password

Select **A one-time password from a smart card** to use a one-time password from a smart card.

Using User's Network Login Credentials

Select **The user's network login credentials** to use the user's directory credentials to log in.

Using Credentials from Another Single Sign-One Enabled Application

Select **Another SecureLogin enabled application** to use the credentials of another application enabled for single sign-on.

Select the application from a list of available applications enabled for SecureLogin.

Selecting Credentials Based on a Value Identified on the Screen

Select **SecureLogin selects credentials based on a value identified on this screen** to provide the credentials based on the presence of a particular value on the login screen.

This option uses a text entry. Regular expressions are supported in the text entry.

For example:

Connecting to server (.*)

where (.*) specifies the value that must be captured to define the credentials.

Identifying the Fields

SecureLogin must identify the fields on the login screen before it can log in to the application. Typically, these are the username and password fields. You can also configure fields such as radio buttons or edit boxes on the login screen. Use the **Identify fields** menu to view the selected fields.

Figure 3-4 Selecting or Reviewing the Login Fields

Do you want to select or review logon fields for SecureLogin to handle?

No. SecureLogin is not required to handle the fields on this screen.

Yes. Let me select or review the logon fields.

SecureLogin will need to know more information to do this.

- ♦ “Not Allowing SecureLogin to Handle the Fields” on page 69
- ♦ “Reviewing the Fields” on page 70
- ♦ “Reviewing Other Fields” on page 70

Not Allowing SecureLogin to Handle the Fields

Select **No. SecureLogin is not required to handle the fields on this screen** if you do not want SecureLogin to handle the login fields on the screen.

Use this option to create a credential set, which can be used with other application screens.

Similarly, you can use the credential set to link to other application definitions.

Reviewing the Fields

- 1 Select **Yes. Let me select or review the logon fields** to review the fields selected by the wizard.

By default, SecureLogin uses the field names as the prompts in the dialog boxes. You can edit the field names to make them clear and user-friendly.

- 2 If the login fields are not identified correctly, identify them manually by dragging the **Choose** icon to the button you want to the fields and clicking the **Show me** icon.

The selected fields are highlighted.

- 3 If **Show me** does not highlight the correct control, update it by dragging and dropping the **Choose** icon to the button you want.

or

Use the **Navigate to field using the keystrokes** option.

3a Click **Start**.

3b Specify the keystrokes.

3c Select **Close** to return to the **Identify fields** menu.

3d Select **Stop** to stop the recording.

The next time you log in to the application, the keystrokes are used to log in.

- 4 Select **Treat text field as a sensitive field** to treat the username field like a password field and disguise the characters with asterisks. This is optional for the username but mandatory for the password.
- 5 (Optional) Specify the text that SecureLogin presents when prompting the user for username and password.

Type the text that SecureLogin presents when prompting for username and password.

Prompt:

Please edit your login variables.

Reviewing Other Fields

- 1 Click **All fields** to show other fields detected by the wizard on the login screen. Each control is listed by type and name (if known).

Select the field you want SecureLogin to use in managing the login for the application, then specify the actions for SecureLogin.

Depending on the application, any or all of the following fields are displayed.

- ♦ Edit box
- ♦ Check Box
- ♦ Combo Box
- ♦ Radio Button

For information about configuring SecureLogin to use these additional fields, see [“All Fields” on page 15](#).

Specifying Re-authentication Rules

- 1 Use the **Re-authentication** menu to specify if users must re-authenticate with their network credentials or an authentication device.
- 2 If you select **No. The user is not required to re-authenticate**, SecureLogin does not prompt users to re-authenticate users before providing the credentials to the application.
- 3 If you select **Yes. Enforce re-authentication before accessing this application**, users must specify the credentials in order to re-authenticate.
- 4 From the **Select from the methods detected** drop-down list, select the method SecureLogin must use.

You can select from:

- ♦ **Use same credentials as network login:** Use the network login credentials.
 - ♦ **Password:** The network password.
 - ♦ **Smart card:** After the PIN is verified, SecureLogin checks to see if the smart card belongs to the user or not.
- 5 You must also specify the action SecureLogin takes when the users cancels the re-authentication. You can define one of the following actions:
 - ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user cancels the re-authentication dialog box. Select the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
 - ♦ **Type the Following Keystrokes:** Define the commands or keystrokes SecureLogin enters when a user clicks **Cancel** in the re-authentication dialog box. To record keystrokes:
 1. Click **Start**.
 2. Specify the **keystrokes**.
 3. After you have recorded the keystrokes, click **Close**.
 - ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

Defining the Submit Options

- 1 Use the **Submit options** menu to define how SecureLogin submits the login screen.
- 2 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the login screen.

How is the logon notification screen submitted?

The user submits the screen

SecureLogin submits the screen

Actions to be taken to complete the notification

- 3 If you select **SecureLogin submits the screen**, specify the action SecureLogin takes to submit the login screen.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Highlight Select the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
 - ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters to submit the login notification screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
 - ♦ **Re-direct the user to this website:** Specify a URL to go to when a user submits the login notification screen.
- 4 You can also specify the action SecureLogin uses when users cancel a prompt to save their credentials. For this, select **Enable action when user cancels to change their password**.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen. Select the button by dragging the **Choose**  icon to the button you want and clicking **Show me**.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters to submit the login screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct users to this website:** Specify a URL to go to when users cancel the change password prompt.

Defining the Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria.

Use the **Matching criteria** menu to define the matching criteria.

- 1 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle the password change.
- 2 If you select **Yes**. Use additional Wizard generated rules, you can add, modify, or remove rules. Your matching criteria must include at least one rule.

After you select this option, the following screen appears:

- 3 By default, **Use Wizard generated rules** is selected.

The **Rules** text box lists the controls that are detected by SecureLogin.

Add new rule by dragging the **Choose**  icon to a specific control.

Click **Show me** to confirm that SecureLogin has identified the correct control.

To modify a rule for a control:

- 1 Select the rule you want to edit, then click **Configure more detailed match for this control**
- 2 Define what SecureLogin must match. You can set the following matching rule:
 - ♦ **SecureLogin is to match value displayed:** If you select this option, SecureLogin only matches those screens that exactly match the displayed text and rules identified.

To verify the regular expression:

- 1 Click **Test Match** to verify if your regular expression is correct.
If a regular expression does not match any control on the application screen, SecureLogin prompts you to verify your regular expression and select the correct control.

To delete a rules:

- 1 Select the rule, then click **Remove**

You have successfully completed creating an application definition for a Windows application. The next time you launch the application, SecureLogin provides the credentials for you.

3.4 Creating an Application Definition for a Java Application or an Oracle Form

SecureLogin supports single sign-on feature for Oracle forms which uses Java 1.7 or 1.8.

A Java application is a Java program that runs independently. The Java Virtual Machine in the client or server interprets the instructions.

For Oracle form applications SecureLogin uses the pre-installed JRE 1.7 or 1.8 in the machine. If any of these Java components is added after installing (or upgrading to) SecureLogin, you need to enable SecureLogin to use the newly added Java component. To enable support to the new Java component, run the repair option of the SecureLogin installer.

You can create an application definition for a Java application or an Oracle application by accepting the default selections in the wizard, or you can manually select the attributes you want.

NOTE: Loading of Oracle components requires some time before an application definition for Oracle form is started. Therefore, the Wizard consumes some time when starting the application definition for Oracle form.

- ♦ [Section 3.4.1, “Prerequisites,” on page 73](#)
- ♦ [Section 3.4.2, “Using the Default Selections to Create an Application Definition,” on page 74](#)
- ♦ [Section 3.4.3, “Manually Defining the Attributes for an Application Definition,” on page 75](#)

3.4.1 Prerequisites

- ♦ In the Java preferences, set the **Add application prompts for Java applications** preference to **Yes**.
- ♦ In the Java preferences, set the **Allow single sign-on to Java applications** preference to **Yes**.
- ♦ Ensure that you have JRE 1.7 or 1.8 to support single sign-on to Oracle Forms.

- ♦ Close all open SecureLogin prompts.
- ♦ Verify if you have permissions to create application definition. See [Chapter 5, “Setting the Wizard Mode Preference,” on page 109.](#)
- ♦ Ensure that SecureLogin is running on your workstation.

3.4.2 Using the Default Selections to Create an Application Definition

- 1 Ensure that you have completed the prerequisites in [Section 3.4.1, “Prerequisites,” on page 73.](#)
- 2 Launch the Java application for which you want to create an application definition.
SecureLogin detects the application and prompts you to enable single sign-on.

Do you want to single sign enable the screen?

- ➔ Yes, I want to single sign using the default selections done by the wizard.
- ➔ Yes, I want to single sign enable the screen using the wizard.
- ➔ Cancel, I do not want to single sign this screen at this time.
- ➔ No, Never prompt me to single sign this screen.

- 3 Select Yes, I want to single sign using the default selections done by the wizard.
The Enter your Credentials dialog box is displayed.

- 4 Specify your credentials, then click **OK**.
SecureLogin saves your credentials in the directory. The next time you launch the application, SecureLogin provides the credentials for you.

3.4.3 Manually Defining the Attributes for an Application Definition

- 1 Ensure that you have completed the prerequisites in [Section 3.4.1, “Prerequisites,”](#) on page 73.
- 2 Launch the Java application for which you want to create an application definition.
SecureLogin detects the application and prompts you to enable the screen for single sign-on.

Do you want to single sign enable the screen?

- ➔ Yes, I want to single sign using the default selections done by the wizard.
- ➔ Yes, I want to single sign enable the screen using the wizard.
- ➔ Cancel, I do not want to single sign this screen at this time.
- ➔ No, Never prompt me to single sign this screen.

- 3 Select **Yes, I want to single sign enable the screen using the wizard**. The Application Definition Wizard page is displayed.
- 4 Configure the following attributes to create application definition.
 - ♦ “Identifying the Screens” on page 75
 - ♦ “Specifying the Credential Source” on page 75
 - ♦ “Identifying the Fields” on page 77
 - ♦ “Specifying Re-authentication Rules” on page 78
 - ♦ “Defining the Submit Options” on page 79
 - ♦ “Defining the Matching Criteria” on page 80

Identifying the Screens

- 1 Use the **Identify screen** tab to identify the login screen. If the Application Definition Wizard identifies the login screen correctly, a check mark  displays next to **Identify screen**.

NOTE: The **Show me** icon fails to highlight the fields identified by the wizard for all embedded Java applets from JRE 1.7 and 1.8. It fails to highlight the corresponding target for all the attributes of the Application Definition Wizard, such as **Identify fields**, **Re-authentication**, **Submit options**, and **Matching criteria**.

- 2 Drag the **Choose**  icon to the detect and select login screen.

Specifying the Credential Source

- 1 Use the **Credential source** tab to define the source of the credentials for the applications.
Some applications use their own credential set to log in. However, some applications might reuse credentials from another source, such as the user's network password or a one-time password.

Which credentials should this application use?

This application's own credential set

Other...

Application re-uses credentials from another source such as network login credentials or a related application

- 2 Select **This application's own credential set** to use the application's credential set to log in.

If you select this option, SecureLogin creates a discrete set of credentials to enable the application. The credential set has the name of the application.

- 3 Select **Other** to define another source of credentials.

If you select this option, select the source of credentials for the application.

Where will credentials for this application come from?

This application requires other credential source

A one-time password from a smartcard

The user's network login credentials

Another SecureLogin enabled application

SecureLogin selects credentials based on a value identified on this screen

The options for the credential source are:

- ♦ [“Using a One-Time Password” on page 76](#)
- ♦ [“Using a User’s Network Login Credentials” on page 76](#)
- ♦ [“Using Credentials from Another Single Sign-One Enabled Application” on page 76](#)
- ♦ [“Selecting Credentials Based on a Value Identified on the Screen” on page 77](#)

Using a One-Time Password

Select **A one-time password from a smart card** to use a one-time password from a smart card.

Using a User’s Network Login Credentials

Select **The user's network logon credentials** to use the user's directory credentials to log in.

Using Credentials from Another Single Sign-One Enabled Application

Select **Another SecureLogin enabled application** to use the credentials of another application enabled for single sign-on.

Select the application from a list of available applications enabled for SecureLogin.

Selecting Credentials Based on a Value Identified on the Screen

Select **SecureLogin selects credentials based on a value identified on this screen** to provide the credentials based on the presence of a particular value on the login screen.

This option uses a text entry. Regular expressions are supported in the text entry.

For example:

Connecting to server (.*)

where (.*) specifies the value that must be captured to define the credentials.

Identifying the Fields

SecureLogin must identify the fields on the login screen before it can log in to the application. Typically, these are the username and password fields. You can also configure fields such as radio buttons or edit boxes on the login screen.

Use the **Identify fields** menu to view the selected fields.

Figure 3-5 *Selecting or Reviewing the Login Fields*

Do you want to select or review logon fields for SecureLogin to handle?

➔ No. SecureLogin is not required to handle the fields on this screen.

➔ Yes. Let me select or review the logon fields.
SecureLogin will need to know more information to do this.

- ♦ [“Not Allowing SecureLogin to Handle the Fields” on page 77](#)
- ♦ [“Reviewing the Fields” on page 77](#)
- ♦ [“Reviewing Other Fields” on page 78](#)

Not Allowing SecureLogin to Handle the Fields

Select **No. SecureLogin is not required to handle the fields on this screen** if you do not want SecureLogin to handle the login fields on the screen.

You can use this option to create a credential set, which can be used with other application screens.

Similarly, you can use the credential set to link to other application definitions and to identify the application screens.

Reviewing the Fields

- 1 Select **Yes. Let me select or review the logon fields** to review the fields selected by the wizard.
By default, SecureLogin uses the field names as the prompts in the dialog boxes. You can edit the field names to make it clear and user-friendly.
- 2 Select **Treat text field as a sensitive field** to treat the username field like a password field and disguise the characters entered with asterisks.

This is optional for the username but mandatory for the password.

NOTE: If the label text for a control is empty or incorrect, do the following:

- ♦ Click **Show me** to verify if the correct control is selected.
- ♦ If **Show me** does not highlight the correct control, update it by dragging and dropping the **Choose** icon or use the **Navigate to field using the keystrokes** option.

-
- 3** Select **Navigate to field using keystrokes** if you are having difficulty identifying the correct fields using other methods. SecureLogin prompts you to use **Navigate to field using keystrokes** if it cannot identify the fields on the login screen.

To record keystrokes:

- 3a** Click **Start**.
- 3b** Specify the keystrokes.
- 3c** Select **Close** to return to the **Identify fields** menu.
- 3d** Select **Stop** to stop the recording.

Next time you login to the application, keystrokes are used to log in.

- 4** You can also specify the text that SecureLogin presents when prompting the user for the username and password.

Type the text that SecureLogin presents when prompting for username and password.

Prompt:

Please edit your login variables.

▲▼

Reviewing Other Fields

Click **All fields** to show other fields detected by the wizard on the login screen.

Each control is listed by type and name (if known).

Select the field you want SecureLogin to use in managing the login for the application, then specify the actions for SecureLogin.

Depending on the application, any or all of the following fields are displayed.

- ♦ Edit box
- ♦ Check Box
- ♦ Combo Box
- ♦ Radio Button

For information about configuring SecureLogin to use these additional fields, see [All Fields](#).

Specifying Re-authentication Rules

- 1** Use the **Re-authentication** menu to specify how users must re-authenticate. Specify if they must re-authenticate with their network credentials or an authentication device.
- 2** If you select **No. The user is not required to re-authenticate**, SecureLogin does not prompt users to re-authenticate before providing the credentials to the application.

- 3 If you select **Yes. Enforce re-authentication before accessing this application**, users must specify the credentials that SecureLogin uses to re-authenticate the user's identity.
- 4 From the **Select from the methods detected** drop-down list, select the method SecureLogin must use. You can select from:
 - ♦ **Use same credentials as network login:** Use the network login credentials.
 - ♦ **Password:** The network password.
 - ♦ **Smart card:** After the PIN is verified, SecureLogin checks to see if the smart card belongs to the user or not.
- 5 You must also specify the action SecureLogin takes when the users cancels the re-authentication.

You can define one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user cancels the re-authentication dialog box.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters when a user clicks **Cancel** in the re-authentication dialog box. To record keystrokes:
 1. Click **Start**.
 2. Specify the **keystrokes**.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user cancels the prompt for credentials. You can redirect users to the login screen and force them to specify the login credentials again.

Defining the Submit Options

- 1 Use the **Submit options** menu how SecureLogin submits the login screen.
- 2 If you select **The user submits the screen**, SecureLogin does nothing and the user must manually submit the login screen.

How is the logon notification screen submitted?

The user submits the screen

SecureLogin submits the screen

Actions to be taken to complete the notification

If you select **SecureLogin submits the screen**, specify the action SecureLogin takes to submit the login screen.

You can specify one of the following actions:

- ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen.
- ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters to submit the login notification screen. To record keystrokes:
 1. Click **Start**.

2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
- ♦ **Re-direct the user to this website:** Specify a URL to go to when a user submits the login notification screen.
- 3 You can also specify the action SecureLogin uses when users cancel a prompt to save their credentials. For this, select **Enable action when user cancels to change their password**. You can specify one of the following actions:
 - ♦ **Click this button:** Select a button on the application that SecureLogin clicks when a user submits the screen.
 - ♦ **Type the following keystrokes:** Define the commands or keystrokes SecureLogin enters to submit the login screen. To record keystrokes:
 1. Click **Start**.
 2. Specify the keystrokes.
 3. After you have recorded the keystrokes, click **Close**.
 - ♦ **Re-direct users to this website:** Specify a URL to go to when users cancel the change password prompt.

Defining the Matching Criteria

SecureLogin must uniquely identify each application screen in order to run an application definition. If SecureLogin cannot uniquely identify a particular application screen, you can manually define the matching criteria. Use the **Matching criteria** menu to define the matching criteria.

- 1 If you select **No. Use minimal rules based on your previous selections**, SecureLogin uses the rules defined in previous attribute panels to identify and handle the password change.
- 2 If you select **Yes. Use additional Wizard generated rules**, you can add, modify, or remove rules. Your matching criteria must include at least one rule.
- 3 By default, **Use Wizard generated rules** is selected. The **Rules** text box lists the controls that are detected by SecureLogin.

To modify a rule for a control:

- 1 Select the rule you want to edit, then click **Configure more detailed match for this control**
- 2 Define what SecureLogin must match. You can set the following matching rule:
 - ♦ **SecureLogin is to match value displayed:** If you select this option, SecureLogin only matches those screens that exactly match the displayed text and rules identified.

To verify regular expression:

- 1 Click **Test Match** to verify if your regular expression is correct.
If a regular expression does not match any control on the application screen, SecureLogin prompts you to verify your regular expression and select the correct control.

To delete a rule:

- 1 To delete a rule, select the rule, then click **Remove**.

You have successfully completed creating an application definition for a Web application. The next time you launch the application, SecureLogin provides the credentials for you.

3.5 Using a Predefined Application Definition

SecureLogin provides a set of predefined application definitions. Use the predefined application definitions to enable applications for single sign-on.

NOTE: SecureLogin does not provide predefined application definitions for Java applications.

- ♦ [Using a Predefined Application Definition to Enable a Web Application for Single Sign-On](#)
- ♦ [Using a Predefined Application Definition to Enable Windows Application for Single Sign-On](#)

3.5.1 Using a Predefined Application Definition to Enable a Web Application for Single Sign-On

- 1 Launch a Web application.

If a predefined application definition exists for that application, SecureLogin automatically detects the application definition.

The SecureLogin dialog box is displayed.

- 2 Select **I want to single sign the screen using the predefined application definition**.

SecureLogin identifies the application and displays the name of the application in the prompt.

- 3 You are prompted to specify the credentials for the application. Specify the username, password, and any other information required.

- 4 Click **OK**.

SecureLogin saves your credentials and uses them to log in to the application.

The next time you launch the application, SecureLogin provides the username and password for you.

Example: Using a Predefined Application Definition to Enable Single Sign-On for Novell WebAccess

The following example demonstrates enabling single sign-on for a Novell WebAccess. SecureLogin provides a predefined application for Novell WebAccess.

This procedure assumes that you already have a GroupWise® account.

- 1 Launch Novell WebAccess.

A predefined application definition exists for Novell WebAccess. SecureLogin detects the application and the SecureLogin dialog box is displayed.

- 2 Select I want to single sign the screen using the predefined application definition. Novell GroupWise Messenger V7.0 Web Login.

The Enter your GroupWise information dialog box is displayed.

- 3 Specify your username and password, then click OK.

SecureLogin saves the credentials and uses them to log in to your GroupWise WebAccess account.

- 4 Test the application definition by logging out and logging in again.

If the application is defined correctly with the correct credentials, you are logged in successfully. If your login is not successful, delete the application definition and repeat the above steps. You might also need to review the application definition for event responses and errors

3.5.2 Using a Predefined Application Definition to Enable Windows Application for Single Sign-On

- 1 Launch a Windows application.

If a predefined application definition exists for that application, SecureLogin automatically detects the application definition.

The SecureLogin dialog box is displayed.

- 2 Select **I want to single sign the screen using the predefined application definition**.

SecureLogin identifies the application and displays the name of the application in the prompt.

- 3 You are prompted to specify the credentials for the application. Specify the username, password, and any other information required.

- 4 Click **OK**.

SecureLogin saves your credentials and uses them to log in to the application.

The next time you launch the application, SecureLogin provides the username and password for you.

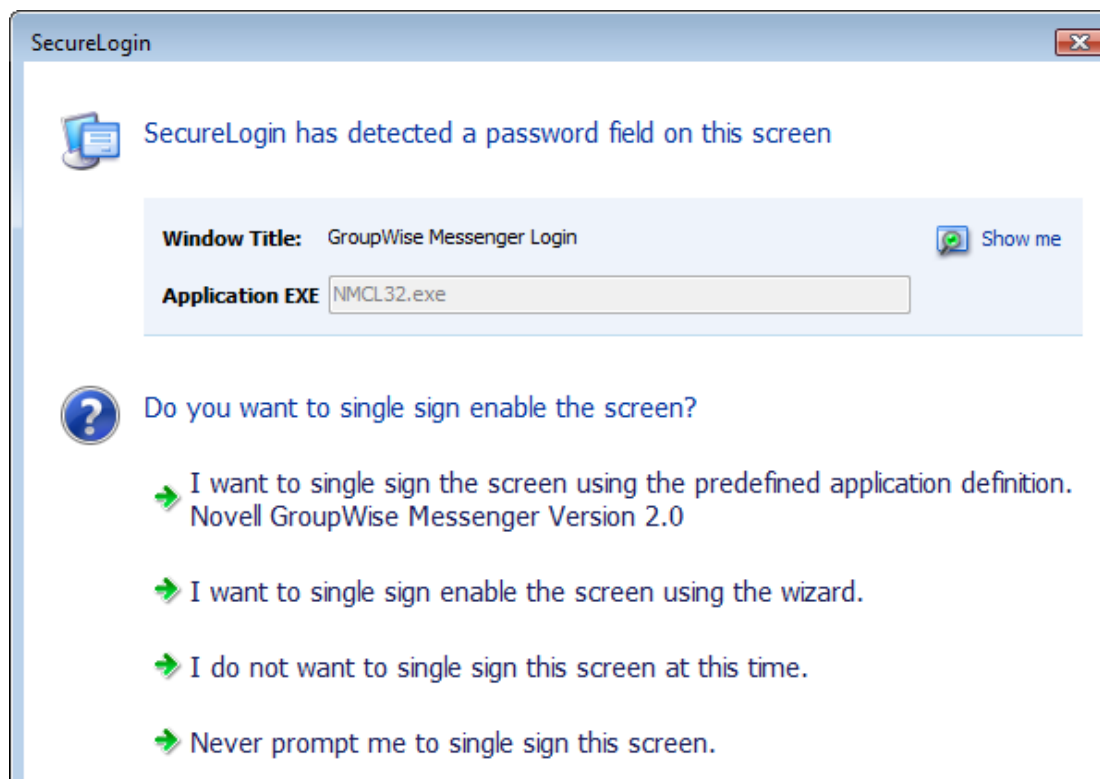

Example: Using a Predefined Application to Enable Single Sign-On for Novell GroupWise Messenger

The following example demonstrates enabling single sign-on for Novell GroupWise Messenger.

This procedure assumes that you already have a GroupWise Messenger account.

- 1 Launch GroupWise Messenger.

A predefined application definition exists for GroupWise Messenger. SecureLogin detects the application and the SecureLogin dialog box is displayed.

- 2 Select I want to single sign the screen using the predefined application definition. Novell GroupWise Messenger Version 2.0.

The Enter your GroupWise information dialog box is displayed.

- 3 Specify your User ID, Password, IP Address, and Port details, then click **OK**.

The image shows a dialog box titled "Enter your credentials". It has a blue header bar with the Novell SecureLogin logo on the left and a red "N" logo on the right. Below the header, it says "Enter your Groupwise information". There are four input fields: "User ID :", "Password :", "IPAddress :", and "Port :". At the bottom, there are two buttons: "OK" and "Cancel".

SecureLogin saves the credentials and uses them to log in to your GroupWise Messenger account.

- 4 Test the application definition by logging out and logging in again.

If the application is defined correctly with the correct credentials, you are logged in successfully. If your login is not successful, delete the application definition and repeat the above steps. You might also need to review the application definition for event responses and errors.

3.6 Testing Application Definitions

You can test only the application definitions that were created by using the wizard. Application definitions created manually or with earlier versions of SecureLogin cannot be tested in the current version.

IMPORTANT: Before you begin to test the application definition, close the application and relaunch it.

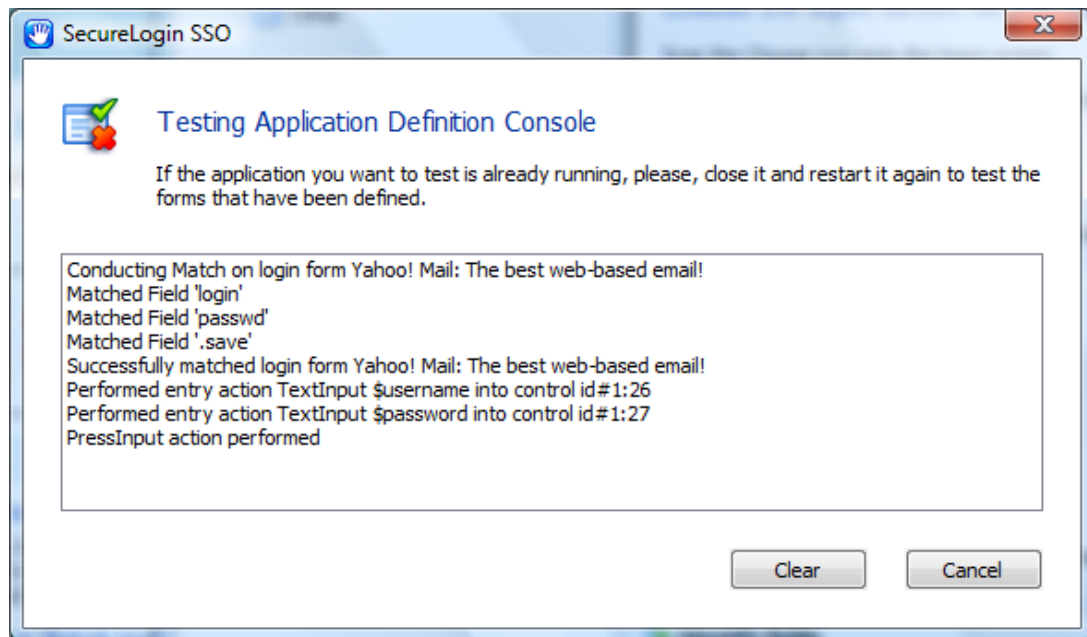

You can test an application definition after you have completed filling in the relevant attributes.

- 1 Make sure you have specified all of the attributes you want for the application definition.
Attributes that are included in the application definition are indicated by a green check mark .
- 2 After you have completed specifying the attributes, click **Test**.
Only saved application definitions can be tested.

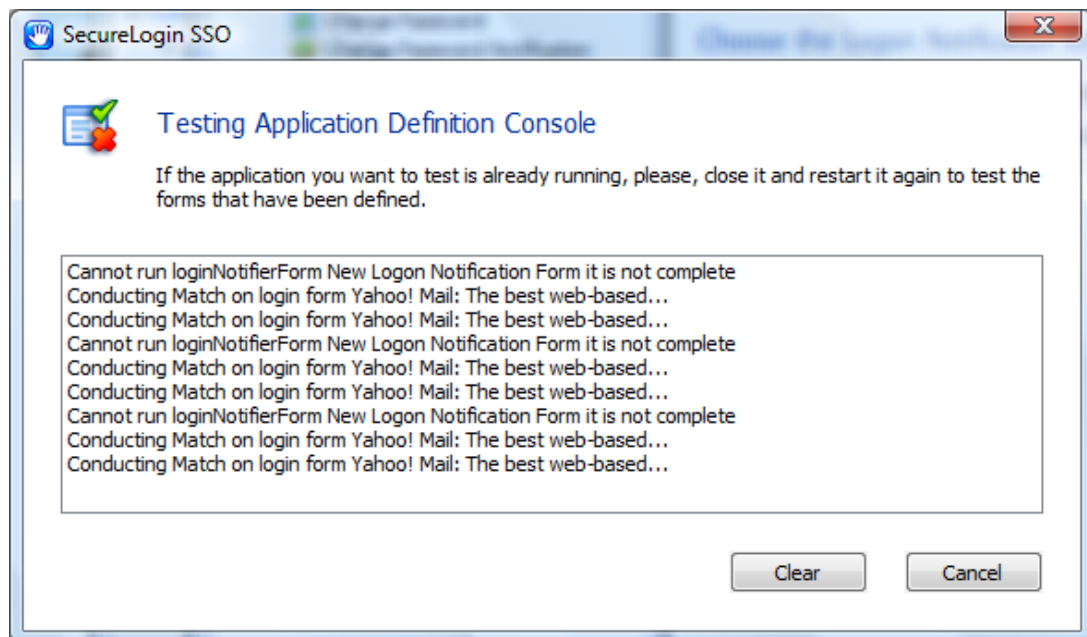

The Testing Application Definition Console displays a log of the following items:

- ◆ The steps SecureLogin takes to match the application you have started with the application definition.
- ◆ The fields matched by the wizard.
- ◆ If the credentials are successful, a message indicating that the login was successful.
- ◆ The actions performed on each of the fields.

- 3 Review the log to troubleshoot possible errors that occurred while creating the application definition.

The following graphic indicates that the application cannot be launched because the **New Logon Notification Form** is incomplete.

- 4 Select **Clear** to clear the log.
- 5 Select **Cancel** to close the Testing Application Definition Console and return to the Application Definition Wizard.

3.7 Deploying Application Definitions

An application definition created using the Application Definition Wizard is stored in the creator's object in the directory. You should create and test an application definition by using a test account before distributing it.

For information about deploying and distributing the configuration, see [“Distributing Configurations”](#) in the *NetIQ SecureLogin CE 24.3 (v9.2) Administration Guide*.

3.8 Configuring Notifications

You can use the Application Definition Wizard to configure notifications such as login notifications and change password notifications.

- ♦ [Section 3.8.1, “Creating an Application Definition for Login Notification,” on page 88](#)
- ♦ [Section 3.8.2, “Creating an Application Definition for Change Password,” on page 93](#)
- ♦ [Section 3.8.3, “Creating an Application Definition for Change Password Notification,” on page 100](#)

3.8.1 Creating an Application Definition for Login Notification

You can use the **Logon Notification** menu to create application definitions that inform the users about an event that occurred during login, such as a mismatch of the username and password or an incorrect password. You can configure the notification to display all or part of the credentials to the user. A login notification is also a message that the application presents after SecureLogin submits the credentials.

NOTE: A login notification cannot be created if a login form is not defined.

For details on the tasks involved in creating a login notification, see [Section 2.1.2, “Login Notification,” on page 23](#).

- ♦ [“Example: Creating a GroupWise Messenger Login Notification” on page 88](#)
- ♦ [“Testing the Login Notification Application Definition” on page 92](#)

Example: Creating a GroupWise Messenger Login Notification

In the following example, you create a login notification for the Google Talk.

Prerequisites

- ♦ Create a login for GroupWise Messenger. That is, an application definition must be created for GroupWise Messenger.
- ♦ This example assumes that you have previously specified an incorrect username or password or, both.

1 Launch GroupWise Messenger.

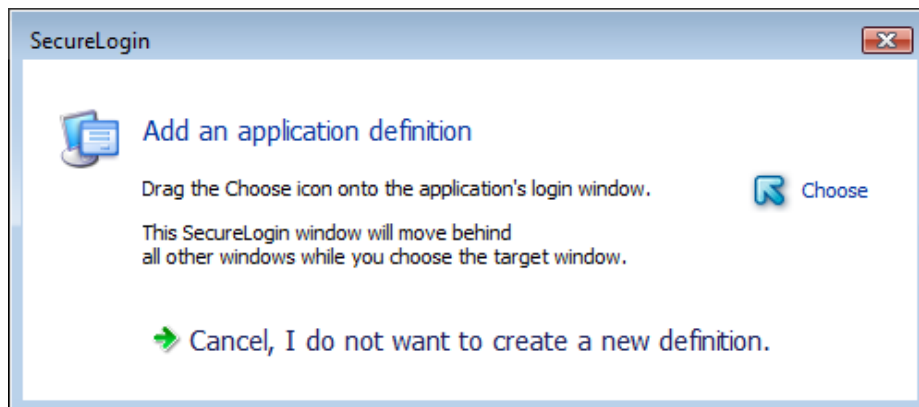

2 (Conditional) Because you have specified incorrect credentials when creating the application definition, SecureLogin detects the incorrect credentials and prompts you to specify correct credentials.

The GroupWise Messenger dialog box is displayed.

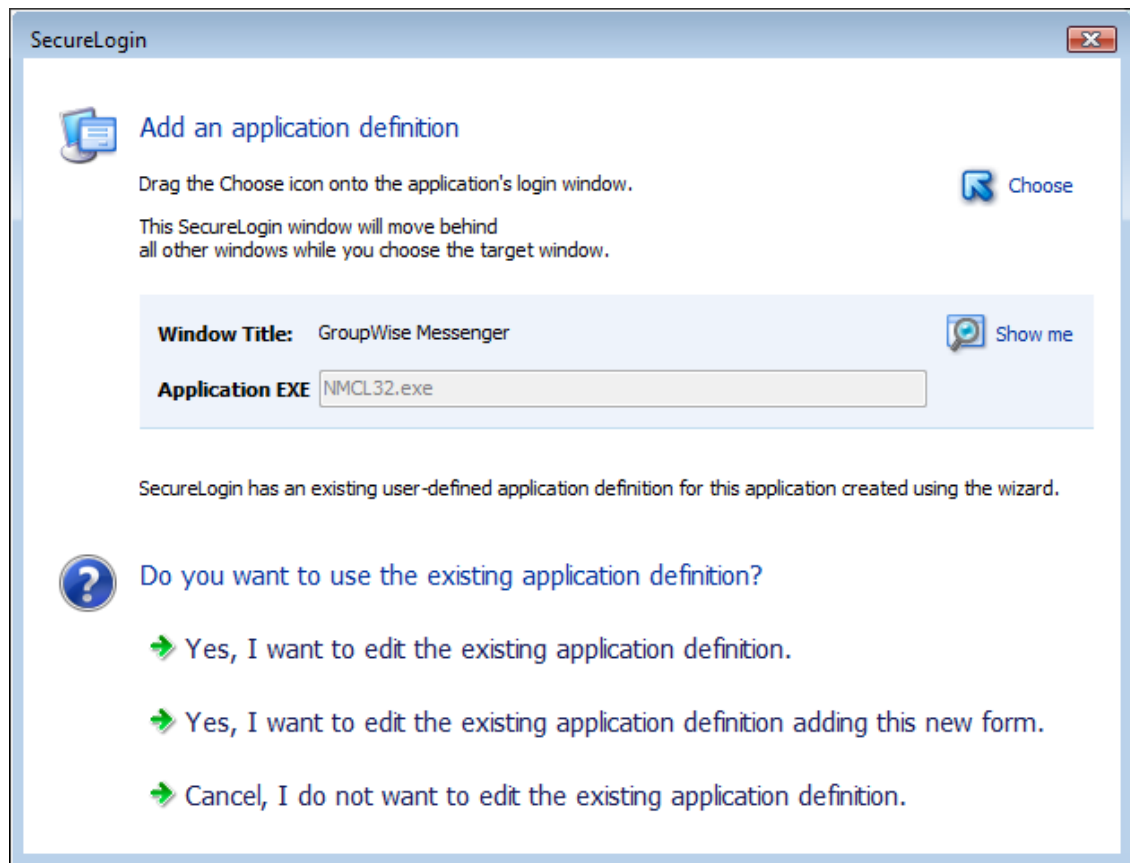

3 Right-click the SecureLogin icon on the notification area (system tray), then select **Add Application**.

The Add an Application Definition dialog box is displayed.

4 In this example, you have specified incorrect user ID and password. To identify the fields, drag the **Choose** icon to the GroupWise Messenger dialog box displaying the error message.

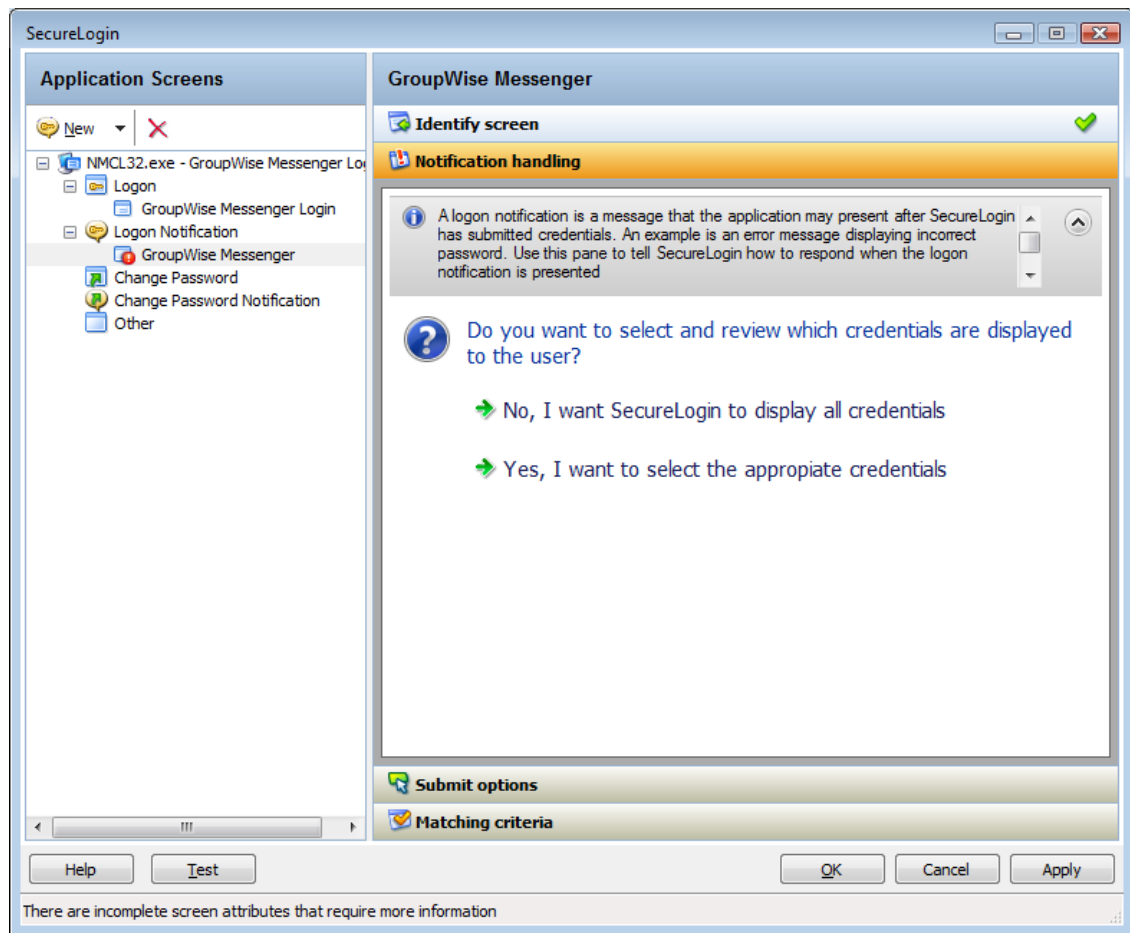

You are prompted to edit the existing application definition, edit the application definition by adding a new form, or not edit the application definition.

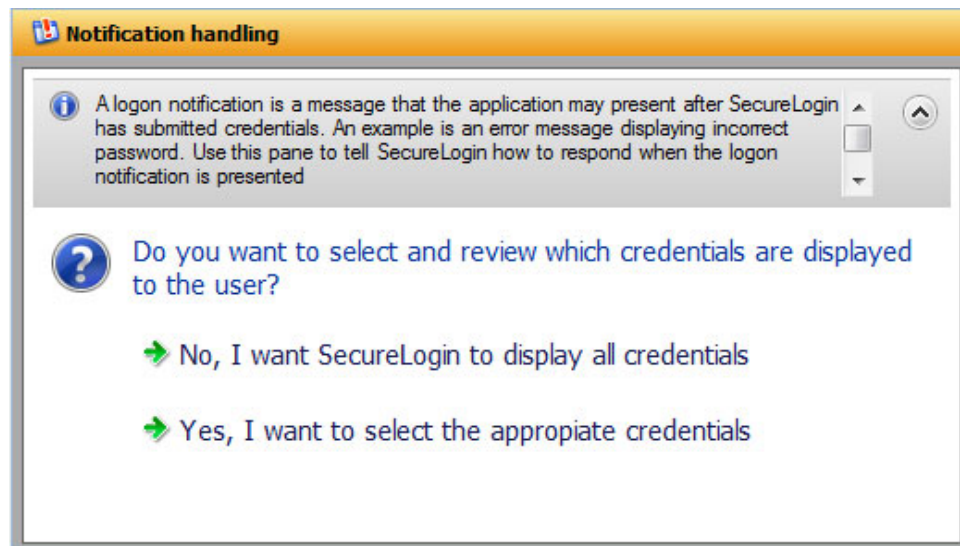

- 5 Select **Yes, I want to edit the existing application definition adding this new form.**

The Application Definition Wizard opens. The Identify Screen menu has a  green check mark because the fields are identified correctly.

NOTE: A form named GroupWise Messenger is created under **Logon Notification**.

6 Navigate to the **Notification Handling** menu.

7 Select **Yes, I want to select the appropriate credentials**.

8 In the **Notification** text box, specify the message that is presented to the user.

Select credentials and review prompt displayed to user

☒ Customize credentials and prompt which are displayed to the user.

Type the text that SecureLogin presents when this notification occurs

Notification

Please enter a valid user ID and password.

Which credentials should SecureLogin make available for user update?

Credentials

password
username

☐ Enable action when user cancels to enter their credentials

- 9 From the **Credentials** list, select the credential for which you want to create a notification. In this example, select **Password**.
- 10 Navigate to the **Submit options** menu.
- 11 Specify how the login notification screen is submitted. Select **SecureLogin submits the screen**.
By default, the **SecureLogin submits the logon notification screen** is selected
- 12 Select the **Click this button** option. In this example, the **OK** button is identified by the wizard to submit the login screen.
- 13 Navigate to **Matching criteria** menu.
- 14 Select **No. Use minimal rules based on your previous selections**.
- 15 Click **Apply** to save your settings.
- 16 Click **OK** to exit the Application Definition Wizard and return to the SecureLogin Client Utility page.
- 17 Click **Apply** and **OK** to exit.

You have successfully created an application definition to handle a login notification. Next, test the application definition.

Testing the Login Notification Application Definition

- 1 Launch GroupWise Messenger.

In [Section 3.8.1, "Creating an Application Definition for Login Notification," on page 88](#) you created an application definition to notify the wrong password.

Because you specified a wrong password when enabling Google Talk for single sign-on, you are prompted to specify the credentials. The message is displayed on the Enter your Credentials dialog box is the message that you specified.

- 2 Specify the correct password to log in successfully.

3.8.2 Creating an Application Definition for Change Password

Application definitions can also include instructions for changing the password for an application. SecureLogin can automatically generate new passwords for an application that match your organization's password policy or it can allow users to select new password. You can also customize the change password prompts displayed to the users.

- ♦ [“Example: Creating a Gmail Change Password” on page 93](#)
- ♦ [“Testing the Change Password” on page 99](#)

Example: Creating a Gmail Change Password

Prerequisite

- ♦ Create a login for Gmail*. That is, an application definition must be created for Gmail.
- 1 Launch Gmail.
 - 2 Navigate to the **Change Password** screen.

Google accounts

Change password

To reset your password, provide your current password OR the answer to your security question.

☒ Current password:

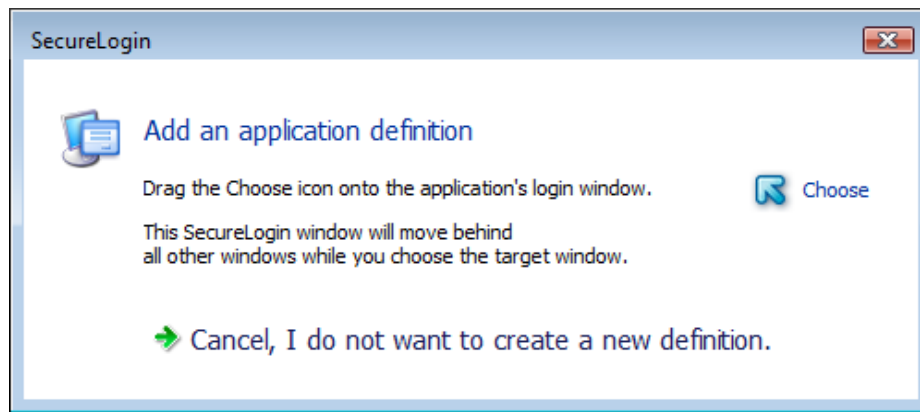

OR

☐ What is your library card number?

New password: [Password strength:](#)

Confirm new password:

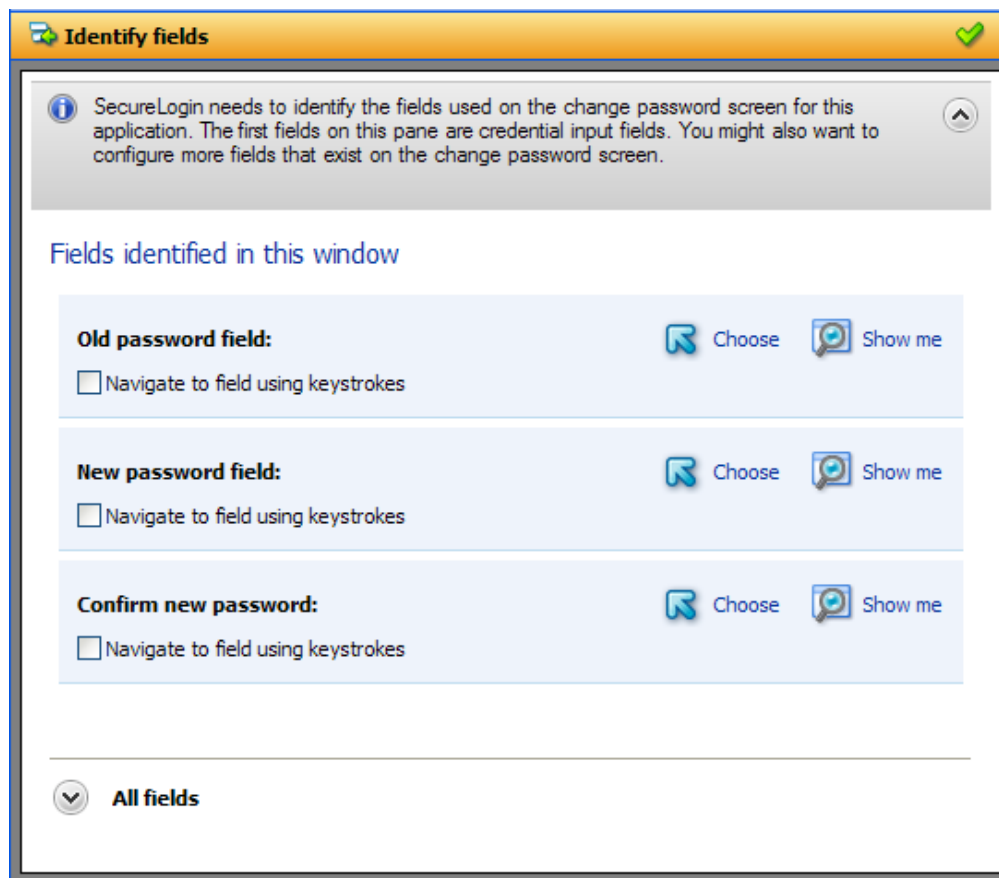

- 3 Right-click the SecureLogin icon on the notification area (system tray), then select **Add Application**.

- 4 Drag the **Choose**  icon to the change password screen.
- 5 Select **Yes, I want to edit the existing application definition adding this new form.**

The Application Definition Wizard opens. The **Identify Screen** menu has a  green check mark because the fields are identified correctly.

By default, the **Identify Fields** menu is displayed.

- 6 From the Fields identified in this windows, click **Show me** to verify if the **Old password**, **New password**, and **Confirm new password** fields are identified correctly.
- 7 Navigate to **Password generation** menu. Specify how you want to generate a new password: whether the user specifies the password or allow SecureLogin to generate a new password.

Password generation

SecureLogin can automatically generate the new password or you can allow the user to select it. Use this pane to tell SecureLogin how the new password is generated and managed.

How will new password be managed?

☐ SecureLogin generates and enters a random password

☒ The user chooses a new password

SecureLogin will present a prompt asking for the new password.
Please type the prompt message here

Prompt:
Specify a new password.

- 8 Select **The user chooses a new password**.
Specify how the new password is managed. By default, **The user chooses a new password** option is selected.
- 9 Specify a prompt that is displayed to the user.
- 10 Navigate to the **Password policy** menu.
Specify whether you want to apply a password policy for the application.

- 11 Select **Yes. Let me specify the password rules.**
- 12 In the **Password policy** field, specify a name for the password policy.
- 13 From the password policy rules, specify the rules that apply to the new policy.

Password policy

 SecureLogin can apply a password policy to new passwords. You can select an existing SecureLogin password policy or you can create a new password policy in this pane.
 

Password policy compliance

The listbox displays all password policies detected for the current user. Select an existing password policy or type a name to create a new policy.

☒ Specify the password rules

Password policy:

Minimum length	6	
Maximum length		
Minimum punctuation characters		
Maximum punctuation characters		
Minimum uppercase characters		
Maximum uppercase characters		

☐ Enforce password history

- 14 Navigate to the **Submit options** menu. Specify how the change password screen is submitted.
- 15 Select **SecureLogin submits the password screen**.

Submit options

Use these options to tell SecureLogin how to submit the change password screen. The submit action could be pressing a button. Alternatively, SecureLogin may do nothing and allow the user to submit the screen.

How is the change password screen submitted?

☒ SecureLogin submits the password screen

How should SecureLogin submit this screen?

☒ Click this button:

Button: Save

 Choose  Show me

☐ Type the following keystrokes:

☐ Re-direct the user to this website:

☐ Enable action when user cancels to change their password

- 16 Navigate to the **Matching criteria** menu. Specify how SecureLogin uniquely identifies each screen.

17 Select **No. Use minimal rules based on your previous selections.**

18 Click **Apply** to save your settings.

19 Click **OK** to exit the wizard.

You have successfully completed creating an application definition for Gmail change password screen.

Testing the Change Password

The next time you launch Gmail and try to change the password, the application definition you created in [Section 3.8.2, “Creating an Application Definition for Change Password,”](#) on page 93.

- 1 Launch Gmail.
- 2 Navigate to the **Change Password** screen. The following dialog box appears.

- 3 Specify the new password and confirm the new password.

IMPORTANT: Ensure that the password policy you have set in [Step 13](#) is adhered.

- 4 Click OK.

3.8.3 Creating an Application Definition for Change Password Notification

A Change Password Notification is a message that the application displays after SecureLogin submits the new password. This might be a confirmation or an error message.

NOTE: You cannot create an application definition for change password notification if a change password form is not defined.

This notification is important for SecureLogin to know whether the password is changed successful because it needs to update the credentials for the application after they are updated.

If an application definition is created for change password but not defined for change password notifications, SecureLogin displays the following prompt:

This prompt appears before updating the credential set with the new password if it is changed successfully.

In the following example, we will create an application definition for change password notification for Gmail application. In this example, we will consider a successful change password.

Prerequisite

- ♦ An application definition is created for Gmail change password form.

Assumption

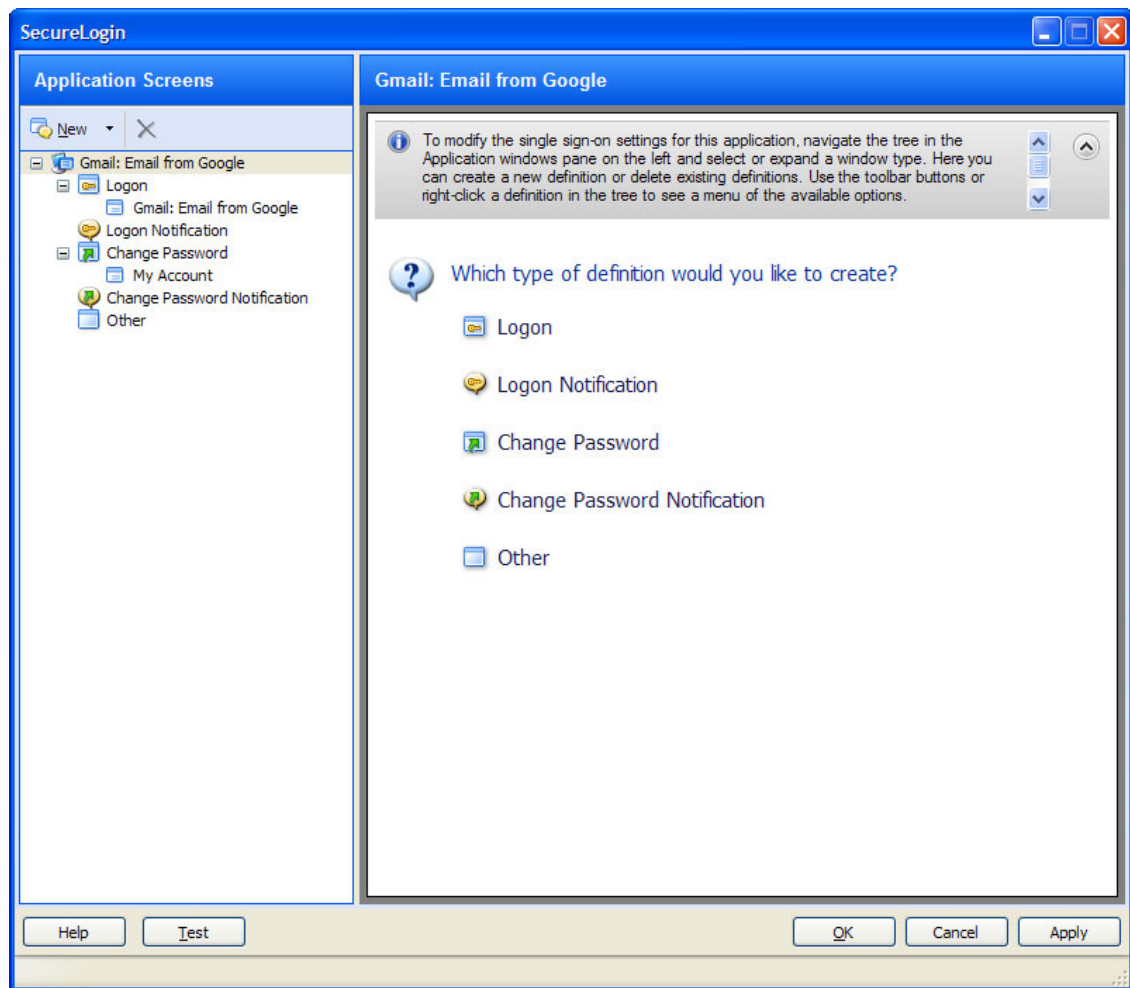

- ♦ The change password for Gmail is successful.
- 1 Because you have not yet defined the change password notification, you are prompted whether the password is changed successfully. The following prompt appears:

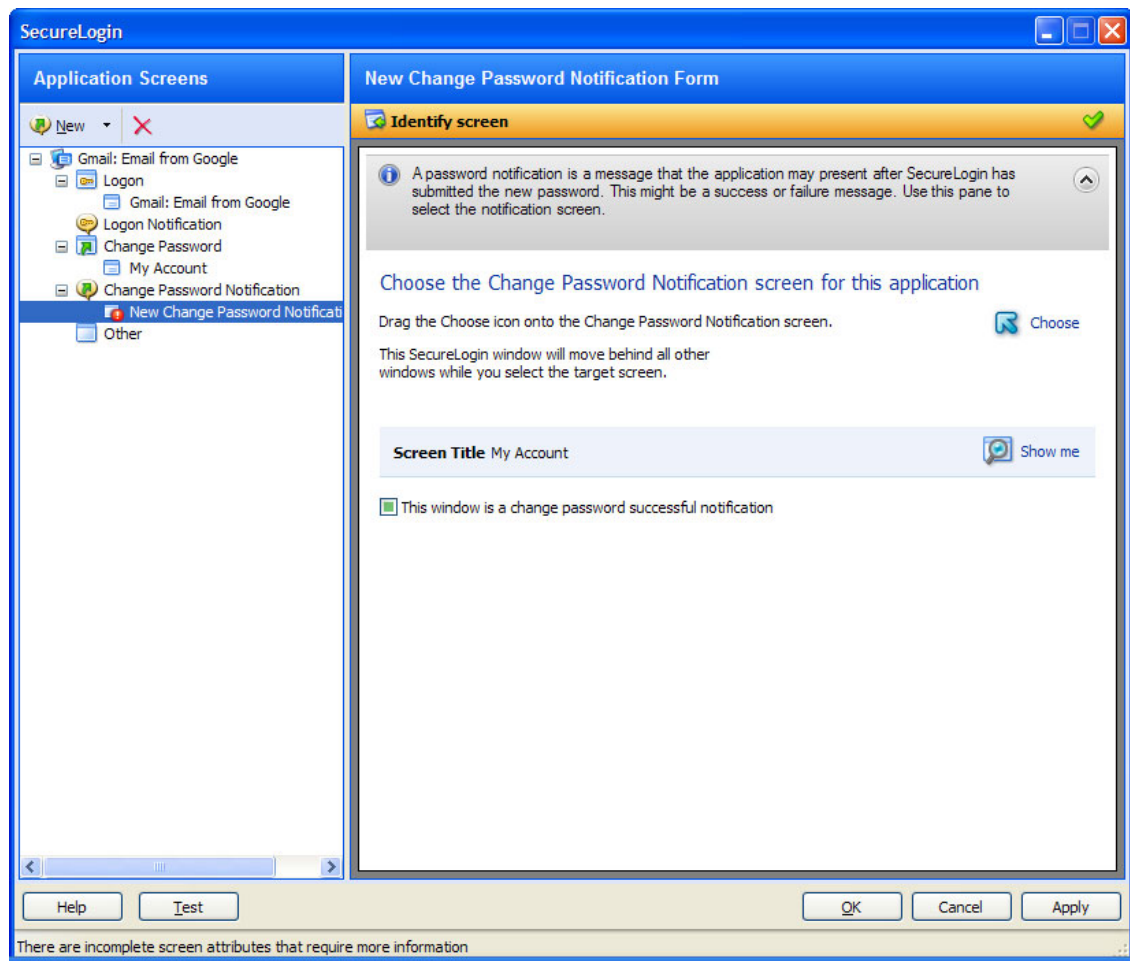

- 2 Right-click the SecureLogin icon on the notification area (system tray), then select **Add Application**.
- 3 Drag the **Choose** icon to the change password successful message screen. In this example the message is, Your new password has been saved - OK.
The Add an Application Definition prompt is displayed.

- 4 Select **Yes, I want to edit the existing application definition**. You are prompted to select the type of definition.
- 5 Select **Change Password Notification**.

- 6 Drag the **Choose** icon to the change password notification screen.
- 7 (Conditional) To specify options that will be available for a user whose password change is successful, select the **This window is a change password successful notification** option. On a successful password change, the changed password is stored and the password notification can be dismissed.
- 8 (Conditional) To specify options that will be available for a user whose password change fails, deselect the **This window is a change password successful notification** option. On a failed password change, the entered password is removed, the password notification is dismissed, and the password change process is restarted.

9 (Optional) Select **SecureLogin** submits the screen.

How is the logon notification screen submitted?

The user submits the screen

SecureLogin submits the screen

Actions to be taken to complete the notification

Continue with [Step 11](#).

- 10 (Optional) Select **Nothing**. Allow user to manage the response.
- 11 Navigate to **Matching criteria** menu. Specify the rules to match.
- 12 Select **No**. use minimal rules based on your previous selections.
- 13 Click **Apply** to save your application definition.
- 14 Click **OK** to exit the wizard.

4 Modifying Application Definitions

You can use the Application Definition Wizard to modify your application definitions.

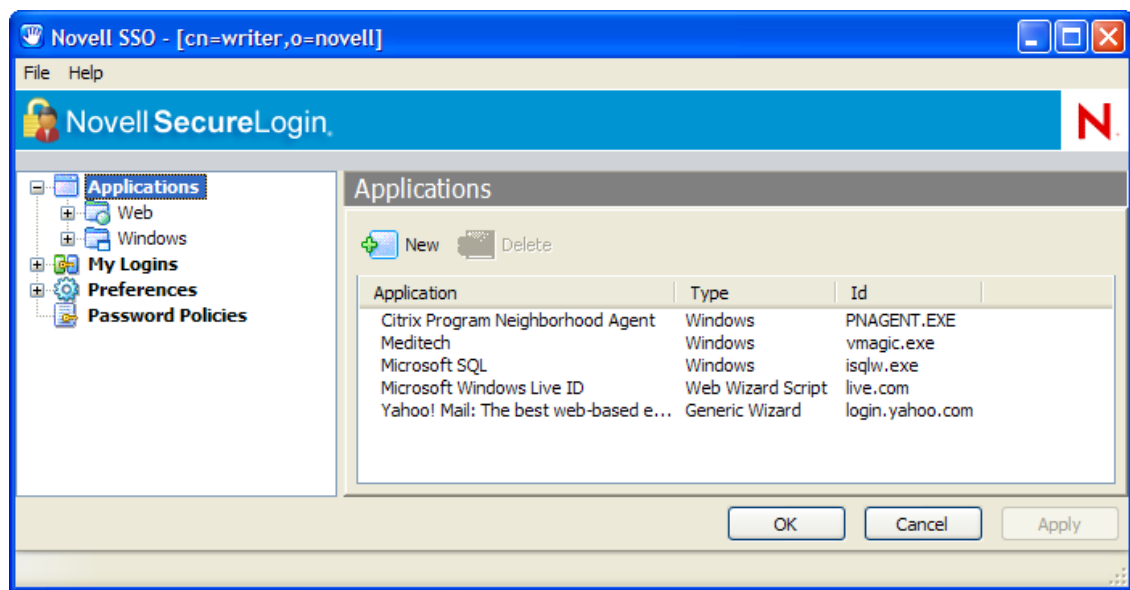

NOTE: Predefined application definitions cannot be edited by using the Application Definition Wizard. You must edit them manually. For more information about editing the application definitions manually, see the [NetIQ SecureLogin CE 24.3 \(v9.2\) Application Definition Guide](#).

You can modify an application definition in one of the following ways:

- Using the Application Definition Wizard to Modify an Application Definition
- Using the Manage Logins Menu to Modify the Application Definition

4.1 Using the Application Definition Wizard to Modify an Application Definition

- 1 Double-click the SecureLogin icon in the notification area.

- 2 In **Applications**, select the application definition you want to modify.
- 3 Select the **Definition** tab.
- 4 Click **Edit Wizard**. The attributes pane opens, enabling you to edit the application definition.

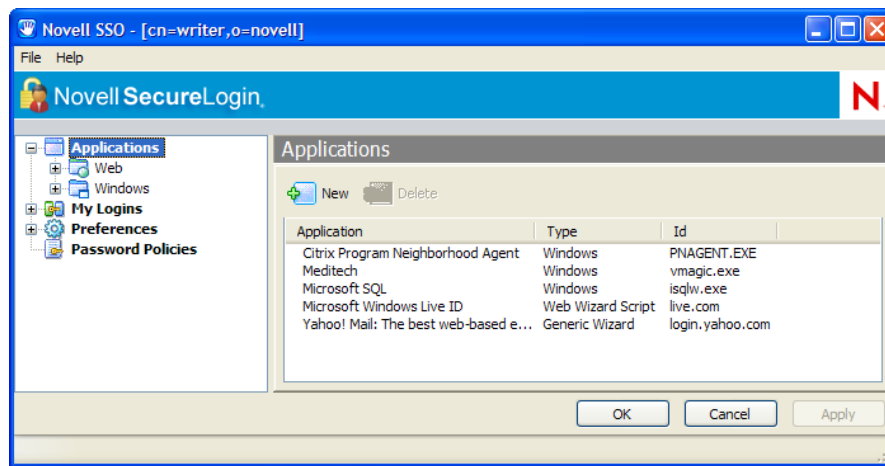

5 Change the application definition.

For more information about attributes that can be modified for an application definition, see [Section 2.1, “The Application Screens Pane,”](#) on page 10.

6 Click **Apply** > **OK**.

4.2 Using the Manage Logins Menu to Modify the Application Definition

- 1 Right-click the SecureLogin icon in the notification area, then click **Manage Logins**.
- 2 The administrative management utility displays a list of applications that are already enabled for single sign-on.

- 3 In **Applications**, select the application definition you want to modify.
- 4 Select the **Definition** tab.
- 5 Click **Edit Wizard**. The attributes pane opens, enabling you to edit the application definition.
- 6 Make the changes.
For more information about attributes that can be modified for an application definition, see [Section 2.1, "The Application Screens Pane,"](#) on page 10.
- 7 Click **Apply** to save your changes.
- 8 Click **OK** to exit.

5 Setting the Wizard Mode Preference

Access to the Application Definition Wizard is controlled by the SecureLogin Wizard Mode preference, which is available in the administrative management utilities. You can enable or disable access to the Application Definition Wizard for users.

- 1 Launch the administrative management utilities (SLManager or MMC snap-ins).
- 2 Navigate to **Preferences > General > Wizard mode**.

Enforce passphrase use	No
Enter API license key(s)	<input type="text"/>
Password protect the system tray icon	No
Provide API Access	No
Stop walking here	No
Wizard mode	Administrator

Administrator

User

Disabled

Default

The **Wizard Mode** has three settings:

- ♦ **Administrator:** The **Administrator** option controls users access to the Application Definition Wizard.

If the **Wizard mode** is set to Administrator, users can create and edit application definitions by using the Wizard.

This is the default setting.

- ♦ **User:** The **User** preference controls a user's ability to create login credential sets for new applications by using the auto-detection setting.

If the preference is set to **User**:

- ♦ The **I want to single sign enable using the wizard** option is not available when an application is detected for single sign-on.
- ♦ The **Edit Wizard** button is disabled in the SecureLogin Client Utility.
- ♦ The **Add Application** option is not available from the SecureLogin icon in the notification area.

- ♦ **Disabled:** This preference controls launching the Application Definition Wizard when an application is detected for single sign-on.

If the **Wizard mode** preference is set to **Disabled**:

- ♦ All automatic prompts to enable an application for single sign-on are disabled. The user is not prompted to enable any application for single sign-on.
- ♦ The **Edit Wizard** button is disabled in the SecureLogin Client Utility.

- ♦ The **Add Application** option is not available from the SecureLogin icon in the notification area.

NOTE: The **Allow user to modify application definitions** preference overrules the **Wizard mode** preference. If users are not allowed to modify application definitions, the Wizard preference has no effect.

- ♦ **Default:** The **Default** setting is the same as Administrator setting.

3 Select the options you want to set.

4 Click **Apply > OK**.

6 Deploying Application Definitions

If you use the Application Definition Wizard to create an application definition, the definition is stored in your user object in the directory.

Restrict the access to the Application Definition Wizard to administrators only. Create and test application definitions on a test account deploying them in the organization. For details on distributing the application definition configurations, see “[Distributing Configurations](#)” in the *NetIQ SecureLogin CE 24.3 (v9.2) Administration Guide*.

For information about manually creating and editing an application definition, see the *NetIQ SecureLogin CE 24.3 (v9.2) Application Definition Guide*.

7 Compatibility with Earlier Versions

The Application Definition Wizard is designed for SecureLogin version 7.0 and later. You cannot use the Application Definition Wizard to edit application definitions created or edited manually by using previous versions. You can only manually edit the application definitions created in the earlier versions.

However, you can export the application definition created in previous versions for manual editing. For details on exporting the application definition configurations, see “[Distributing Configurations](#)” in the *NetIQ SecureLogin CE 24.3 (v9.2) Administration Guide*.

To edit the old application,

- 1 Double-click the SecureLogin icon on the notification area (system tray).
- 2 From the **Applications** list, select the application definition you want to edit.
- 3 Click the **Definition** tab, then click **Convert to Application Definition**.

The application definition pane opens in the **Definition** tab.

- 4 Manually add the application definition and export to the earlier version.

IMPORTANT: If you want to edit a particular application definition using the Wizard, delete the earlier application definition from the directory before editing the chosen application definition.

8

Limitations, Tips, and Troubleshooting

Some applications cannot be enabled for single sign-on using the Application Definition Wizard. This section provides information of the support for such applications.

- ♦ [Section 8.1, “Limitations,” on page 115](#)
- ♦ [Section 8.2, “Tips,” on page 116](#)
- ♦ [Section 8.3, “Troubleshooting,” on page 119](#)

8.1 Limitations

- ♦ [Support for .NET Framework](#)
- ♦ [Support for Non-Natively Supported UI Framework](#)
- ♦ [Defining Password Notification](#)
- ♦ [Specifying Re-authentication Rules](#)
- ♦ [Incorrect Login Notifications in Mozilla Firefox](#)
- ♦ [Single Sign-On For Microsoft Windows Vista Remote Desktop Client](#)

8.1.1 Support for .NET Framework

SecureLogin 8.1 supports .NET Framework 3.5 SP1 and later. However, the .NET Framework should already exist for SecureLogin to use it. So, ensure that the framework is available in your system before installing SecureLogin 8.1 or upgrading to SecureLogin 8.1.

8.1.2 Support for Non-Natively Supported UI Framework

You cannot enable single sign-on for applications that are built in on non-natively supported UI framework such as Microsoft .NET framework, Gecko, and QT.

For example, applications such as Mozilla Thunderbird 2.0.0.18, Novell iFolder cannot be enabled for single sign-on using the Wizard. The Wizard fails to detect the control to enable these applications. You can however, enable single sign-on for such applications without using the Wizard.

For some applications, such as Mozilla Thunderbird, though you can use the keystrokes, SecureLogin identifies the login fields wrongly. It identifies both the username and password fields only when the password dialog box appears.

To resolve this problem, deselect the **Navigate to field using keystroke** option for the username and proceed to enable single sign-on.

The buttons in Windows applications that contain QT controls are displayed as Edit fields.

This incorrect identification is because all QT controls are part of an unsupported Windows class framework, QWidget. As buttons are also QWidget, they are identified and displayed as Edit fields.

8.1.3 Defining Password Notification

You cannot use the Application Definition Wizard password notification if the application displaying the password notification, such as invalid credentials is different from the application displaying the credentials.

For example, application definition for Novell iPrint Client fails because the Windows Wizard does not detect failed authentication.

This is a limitation in the design of the Wizard. The application prompting for credentials is different from the application displaying the authentication failure. The Wizard does not support this and it is handled by the `SetPlat` script. For information about the “`SetPlat`” script, see the [NetIQ SecureLogin CE 24.3 \(v9.2\) Application Definition Guide](#).

NOTE: The limitation applies to all applications where the notification dialog box is different from the application used by the Wizard.

8.1.4 Specifying Re-authentication Rules

If you have deployed SecureLogin in the Standalone mode, you cannot specify re-authentication rules. The re-authentication rule does not apply to SecureLogin in the Standalone mode. The Application Definition Wizard does not recognize the mode of deployment.

8.1.5 Incorrect Login Notifications in Mozilla Firefox

The Application Definition Wizard cannot define login notifications such as incorrect password or incorrect login that are displayed through browser pop-ups in Mozilla* Firefox*. The Application Definition Wizard considers the popup windows as URL and tries to add them to the already defined definition for that URL.

8.1.6 Single Sign-On For Microsoft Windows Vista Remote Desktop Client

SecureLogin might not pass the correct domain name while performing a single sign-on operation for the Microsoft Windows Vista Remote Desktop client in either the Novell Client or LDAP mode.

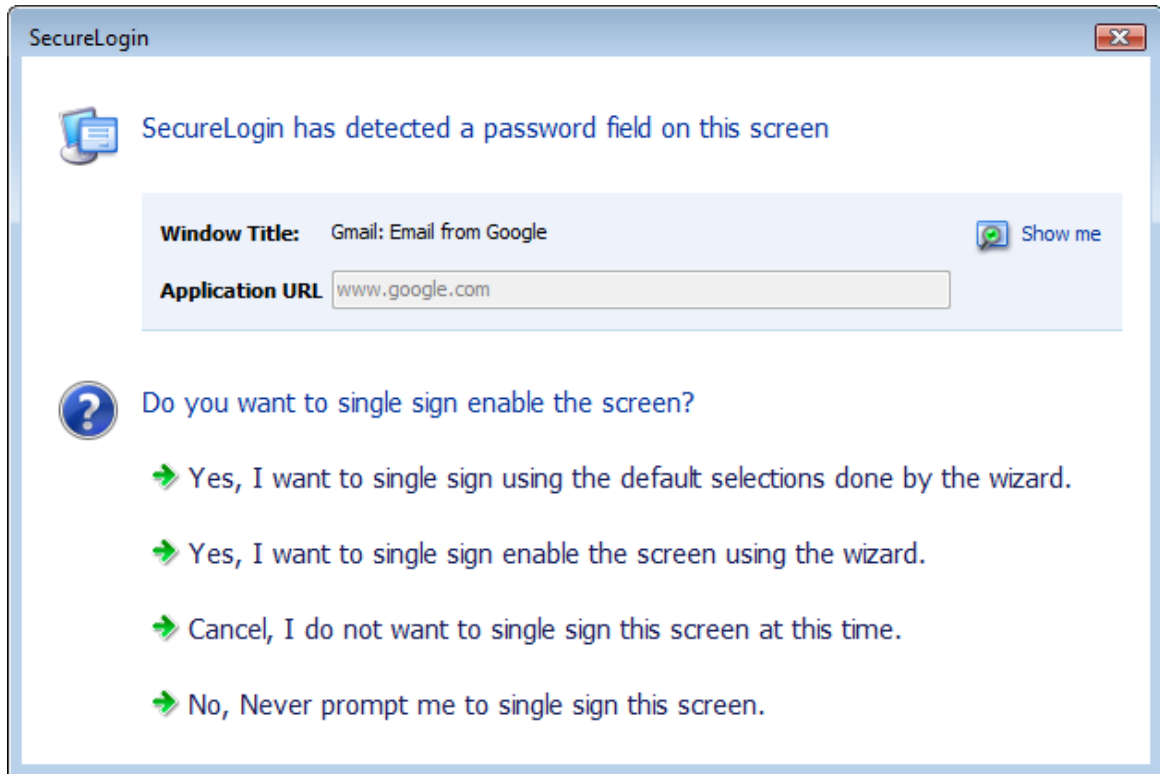

8.2 Tips

- ♦ [Section 8.2.1, “Detecting Multiple Controls,” on page 117](#)
- ♦ [Section 8.2.2, “Using Dynamic Controls,” on page 118](#)
- ♦ [Section 8.2.3, “Citrix Published Applications,” on page 118](#)
- ♦ [Section 8.2.4, “COM Applications,” on page 118](#)

8.2.1 Detecting Multiple Controls

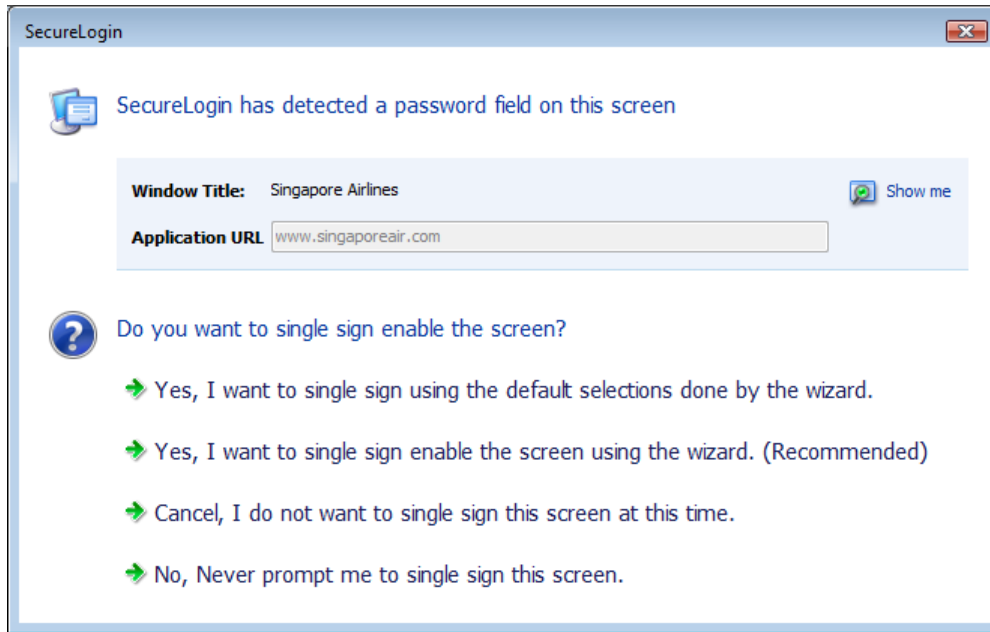

When SecureLogin detects a typical, simple login screen containing a username field, password field, and a submit button, it displays the following prompt:

Figure 8-1 Prompt to Enable Simple Login Screens

A complex login screen might offer users a choice to log in to different network, check the status of a flight, and similar multi-actions. When a complex login screen is detected, the following prompt is displayed.

Figure 8-2 Prompt for Complex Screens

Select **I want to single sign-on enable the screen using the wizard. (Recommended)** to review and if necessary edit the selection done by the Wizard.

Alternatively, you can define the application using the default selection done by the Wizard and edit the definition, later.

8.2.2 Using Dynamic Controls

You can use the Windows Finder tool to identify whether your application uses dynamic controls. For information about using the Windows Finder tool, see [“Finding Application Details with Window Finder”](#) in the *NetIQ SecureLogin CE 24.3 (v9.2) Application Definition Guide*.

If an application uses dynamic controls, use the **Navigate to field using keystrokes** option to select and populate the fields. See [Section 2.5, “Recording Keystrokes,”](#) on page 52.

8.2.3 Citrix Published Applications

The Application Definition Wizard does not detect Citrix published applications. Run the applications on a workstation to manually create an application definition by using the Wizard.

8.2.4 COM Applications

The Application Definition Wizard cannot differentiate between a COM application (where Internet Explorer* is the top parent) prompt and a genuine Internet Explorer prompt. To create an application definition for COM applications, extend the default Internet Explorer script or create a new one based on the Internet Explorer model.

8.3 Troubleshooting

- ♦ [Section 8.3.1, “Redirecting to the Login Page,” on page 119](#)
- ♦ [Section 8.3.2, “Remote Desktop Connection,” on page 120](#)

8.3.1 Redirecting to the Login Page

Some web applications such as Novell iFolder, Quickfinder, ZENworks Configuration Management, and ZENworks Linux Management display the login failure notifications on the same page as the login notifications. When a Login Notification page is detected for such applications, it prompts for correct credentials. Because the user has already provided the credentials, SecureLogin does not re-enter the new password. To resubmit the new credentials, redirect the user to main login page.

In the following example, the user has specified incorrect credentials when logging in to Novell ZENworks Control Center. The user must be redirected to the main login page to specify the correct credentials.

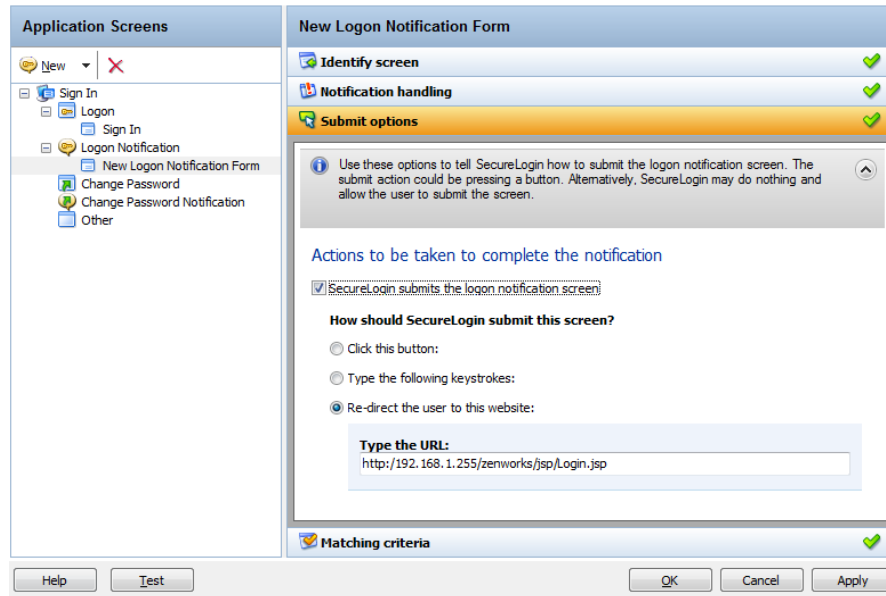

The screenshot shows the Novell ZENworks Login page. At the top, there is an orange header bar with the text "Novell® ZENworks® Login" on the left and a "Help" link on the right. Below the header, there is a blue information icon followed by a note: "Note: Your username or password is incorrect, please check spelling and try again". The main form area contains four input fields: "Management Zone:" with the value "CIT_ZLM", "Username:" with the value "Username1", "Password:" with masked characters "*****", and "Language:" with a dropdown menu showing "English". At the bottom right of the form is a "Login" button.

To redirect the user:

- 1 While creating the login notification, under **Submit options**, select **Re-direct user to this website**.

2 Specify the URL for redirection.

The next time incorrect credentials are submitted, the following events occur:

1. The Login Notification is detected.
2. User is prompted for credentials.
3. User specifies correct credentials.
4. SecureLogin redirects to the login page.
5. SecureLogin submits the credentials and logs in the user successfully.

8.3.2 Remote Desktop Connection

When a Windows application is detected, SecureLogin scans the application to detect if there is a valid script or if it must be enabled for single sign-on.

Similarly, in a remote desktop connection when applications are inactive, SecureLogin scans for Windows applications and prompts you to enable them for single sign-on.

This is an expected behavior.

If you want to enable a remote desktop client, use a pre-built script. By default, on Microsoft Windows Vista, the pre-built passes the system credentials, that is, the network credentials are sent to connect to the RDP session. If you want to change the behavior, do one of the following:

- ♦ Set `$PassSysVariableOnly` to **No**. You are prompted to enter your system or other credentials.
- ♦ Set `$PromptForCredentialChangeOnEachLogin` to **Yes**. You are prompted to select a credential set each time you log in.

NOTE: The remote desktop client application has two different GUIs on Microsoft Windows XP and Microsoft Windows Vista*. This makes it complex if the application definition must run on both platforms. Particularly on Microsoft Windows Vista, the Wizard defines this application using the **Navigate to field using keystrokes** option.
