

NetIQ Access Manager

Deliver secure access to applications and services

Supporting federation standards, OpenText™ NetIQ™ Access Manager enables organizations to share private information across web, cloud, and mobile securely and conveniently. Granting secure access is more than just knowing who needs it. So NetIQ Access Manager adapts to the right level of user identification based on risk.

Single sign-on

Deliver secure single sign-on (SSO) access to intranet and cloud-based applications, to any device in any location. How? NetIQ Access Manager supports federation protocols and offers technologies for digital resources that don't support these standards.

Risk-based engine & two-factor authentication

Keep access simple when risk is low and strengthen user verification as risk grows. NetIQ Access Manager uses less hardware, deploys faster, and requires less maintenance, giving you faster time to value and lower cost of ownership.

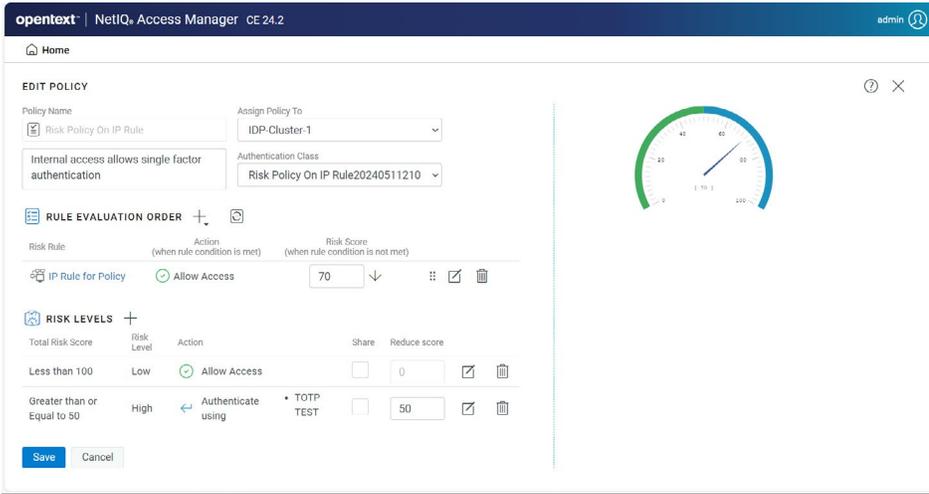

Customizable login portal

For organizations that want to enhance their login page, NetIQ Access Manager includes an optional portal. And you don't even need a developer to customize it. The configurable application icons adapt to the form factor from which they are consumed, requiring less time and expertise.

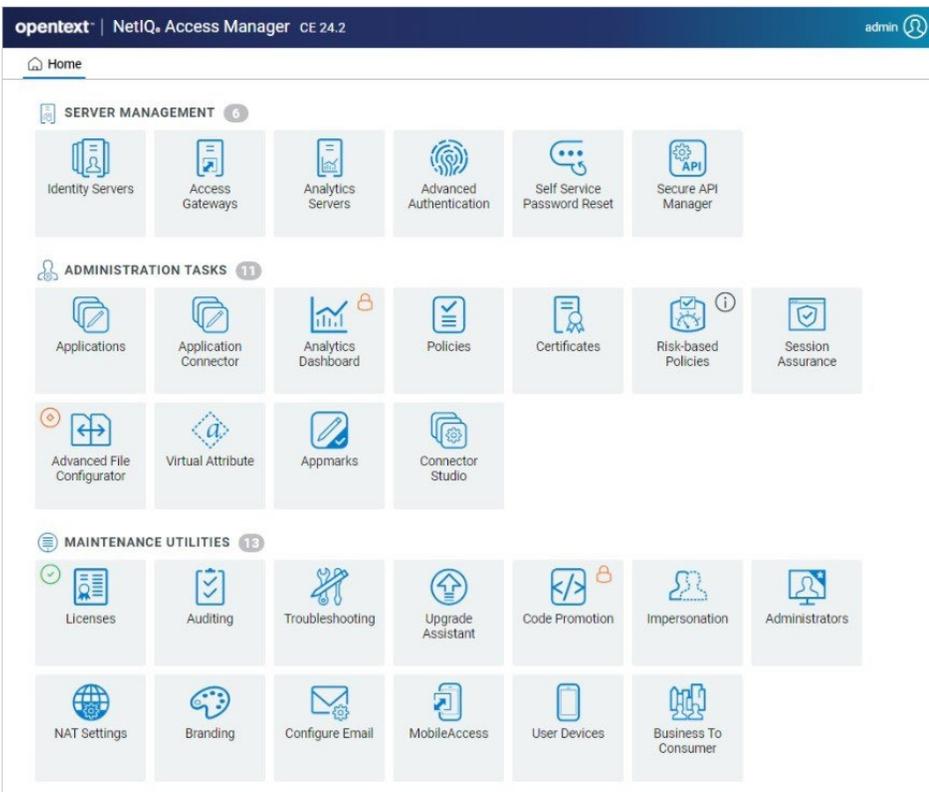

Product highlights

- Provide single sign-on to any digital resource.
- Adopt user-friendly passwordless authentication to avoid phishing.
- Match authentication strength to the current risk of an access request.
- Bring together disparate web services into a simplified or single sign-on user experience.

Features	
Support for federation protocols	Offer SSO with SAML, OAuth, OpenID Connect, WS-Federation, and more. Support also includes native APIs for iOS and OIDC mobile platforms.
Out-of-the-box full account integrations	Office 365, Salesforce, Google Apps, ServiceNow, LogMeIn, Dropbox, Box, DocuSign, Tableau Online, Zendesk are all supported.
Simplified form factors	NetIQ Access Manager is also available as portable Docker containers, which offer deployment and administrative flexibility.
Robust access gateway	Protect any digital asset with a simplified access gateway for online and mobile users—with minimal setup.
Centralized policy engine	Give the right access to the right people with access authorization policies that span the web, cloud, and mobile.
API-driven access management	Robust APIs allow IT organizations to integrate and programmatically automate access controls from their own global consoles.

Access Manager has built in metrics that allows you to set context requirements to control authentication experience and authorization levels for that session

The refreshed interface is more intuitive, making it easier to accomplish tasks
