

# Exchange Administrator

Exchange Administrator gives you greater control, flexibility, and security when moving Microsoft Exchange mailboxes, distribution lists, contacts, and public folders from one organization or site to another. With support for Exchange 2003 through Exchange Server 2010, Exchange Administrator can help you satisfy your migration and transition requirements.

## Product Overview

OpenText™ Exchange Administrator delivers a project-based approach that helps you plan, test, and automate the migratory tasks required to transition your Exchange infrastructure. OpenText's approach to migration helps you dramatically reduce the time, effort, and knowledge required to complete this complex and time-sensitive effort.

## Product Overview

- **Delivers powerful migration planning and analysis**—Helps optimize the migration effort by facilitating improved planning. Automated conflict analysis identifies potential roadblocks, allowing them to be addressed prior to any migration. Exchange Administrator also simplifies the test process, allowing migrations to be validated before implementation.
- **Helps ensure the availability of the Exchange messaging service**—Implements an always-on approach that makes the migration effort transparent to the end user, allowing mail to be sent and received as normal during the migration.
- **Assists in migration cost reduction**—Uses a project-based approach that enables the implementation of a planned, phased effort. Automation of time-consuming, repetitive migration tasks reduces overall migration time and administrator workload.
- **Simplified assessment and preparation**—Facilitates automatic discovery of

mailboxes, distribution lists, contacts, and public folders. System resources are also validated to ensure migration success.

- **Extensive migration flexibility**—Allows administrators to decide the pace at which to execute the migration project, enabling a multi-phased rollout to the new infrastructure.
- **Migration recovery**—Ensures that the migration resumes when interrupted.

## Features and Benefits

Organizes and directs the migration:

- Project-based, wizard-driven approach provides easy-to-follow steps that define the scope of the migration, the target and source servers, any customizations, and the Exchange objects to be migrated
- Rich reporting that enables rapid assessment of the Exchange environment before, during, and after the migration—helping to assess progress and success

Automates migratory tasks:

- Customizable migration using scriptable interfaces to execute pre- and post-migratory event actions, assuring the migration maps to your unique requirements
- Built-in conflict handling, allowing administrators to skip, merge, or replace Exchange mailboxes, distribution lists, and contacts when collisions of email addresses occur

## System Requirements

## Exchange Administrator delivers a project-based approach that helps you plan, test, and automate the migratory tasks required to transition your Exchange infrastructure.

Connect with Us

**Figure 1.** Exchange Administrator provides numerous reports to help you plan for your migration, gauge its progress, and confirm its success.

- Switch mail flow wizard, simplifying the transition of users from the source to the target Exchange server
  - Complete user profile migration, maintaining security settings and preferences when updating contact, calendar, and mailbox data
  - Synchronized directory information, including address book information and distribution list memberships between the source and target Exchange environments
  - Synchronized calendar information, including free/busy details, maintaining scheduling capabilities on both platforms during migration, so users are unaware that two separate infrastructures exist during the migration
- Offers comprehensive migration scenario support:
- Migration support through to Exchange Server 2010, facilitating the transition from Exchange 2000/2003 environments to Microsoft's latest messaging platforms, Exchange Server 2007/2010
  - Inter-organizational migrations from Exchange 2000/2003 to Exchange 2000/2003 or Exchange Server 2007/2010
  - Public Folder to SharePoint migrations, allowing organizations to identify Public Folders in legacy Exchange environments and migrate contents to user-defined SharePoint sites
