

# Reflection ZFE

Micro Focus® Reflection® ZFE is a web-based, zero-footprint terminal emulator for the modern enterprise. With Reflection ZFE, there's no need to manage desktop software or Java runtime environments. Instead, you can quickly configure and deploy terminal emulation functionality to end users from a single central location—reducing IT costs and desktop maintenance time.

## Product Highlights

### Eliminate Terminal Emulation Software at the Desktop

With Reflection ZFE, you can stop the endless cycle of loading, updating, and supporting terminal emulation software across the desktops in your organization. It's easy to deploy terminal emulation sessions to users with nothing to install or patch and no configurations to make at the desktop. Users will get instant access to the mainframe applications they need, from wherever they are.

### Team with Micro Focus Host Access Management and Security Server (MSS)

Your Reflection ZFE license includes MSS, which strengthens security through effective management. Working with your Identity and Access Management (IAM) system, Reflection ZFE seamlessly propagates changes to application settings and user-specific content—all from a central server. You can lock down 100s (or 1000s) of desktops with ease. Grant or deny access based on group or role. And automatically sign users on to their mainframe applications, which means you can say goodbye to mainframe passwords.

### Satisfy Users without Losing Control

With Reflection ZFE, you can optimize the user experience and still retain IT control. Use familiar tools—keyboard mapping, color settings, and quick keys—to personalize sessions on diverse user devices. Create time-saving macros—or allow users to create macros for themselves. ZFE's suspend and resume functionality lets users start a session in the office and resume it later from someplace else. Freedom to move for them, fewer headaches for you.

### Meter Usage and Optimize Resources

Reflection ZFE's centralized activity logging allows you to identify how many and which users are accessing host systems at any given time, and the total number of sessions they are using. With this in-depth level of metering and reporting, you can stay apprised of Reflection ZFE session usage and more effectively allocate computing resources. And you can do so without making any changes to your host systems, minimizing disruption and complexity.

### Implement the Latest Security Measures

Reflection ZFE protects your valuable business and customer data with highest-level SSH and SSL/TLS encryption—facilitating compliance with industry and governmental standards in the process.

## Quick View

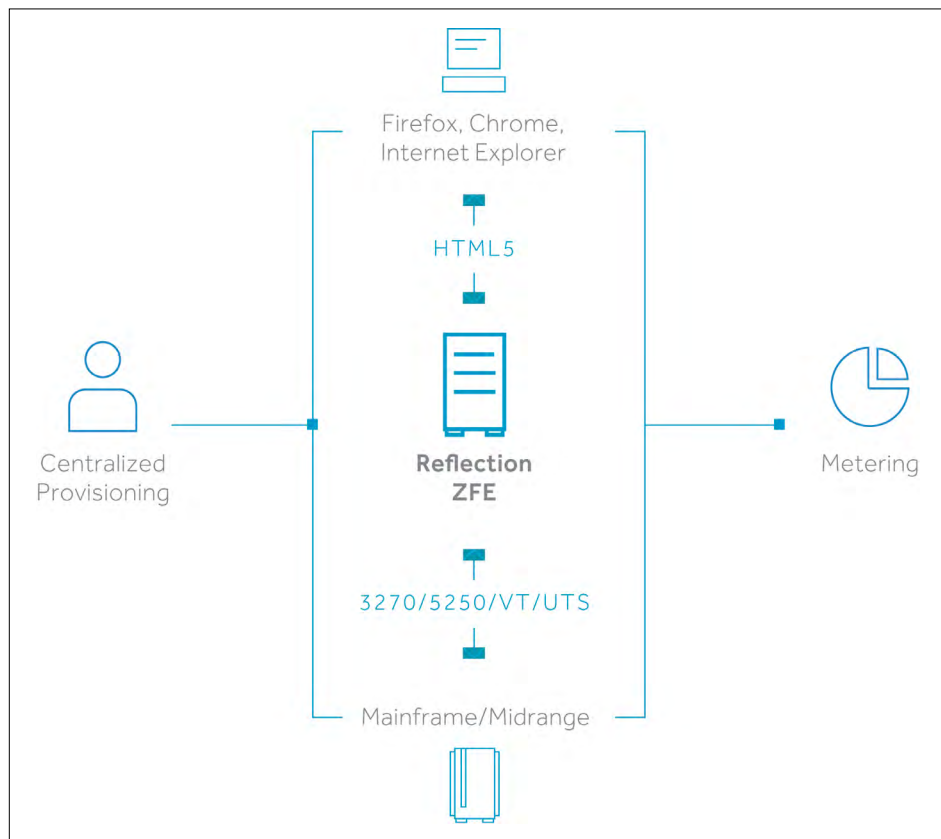

- Browser-based HTML5 access to a broad range of host applications:
  - Reflection ZFE (3270, 5250, VT)
  - Reflection ZFE for Unisys (UTS [INT1] and T27)
  - Reflection ZFE for Airlines (ALC [MATIP])
- Centralized configuration, delivery, and management of mainframe sessions.
- Familiar customization features, including color and keyboard mapping plus quick keys.
- Ability for users to record and edit macros at the admin's discretion.
- Ability to leave a session and resume it later from a different device.
- Ability to log and meter user and session activity.
- SSH and SSL/TLS encryption.
- Active Directory/LDAP integration.
