

Data Protector's Integration Advantage for ITOM

Backup Modernization with Micro Focus Data Protector and the ITOM product Suite.

Data protection is more critical today than ever with increasing cyber-attacks, the need to track and meet strict SLAs to protect critical applications, and scale to protect data that is scattered across different platforms—both legacy and modern. Micro Focus continues to boost its Data Protector Software with new capabilities including advanced analytics, automation, and new platform integrations that help customers meet their backup and recovery challenges.

Data Protector is a backup solution for Enterprise customers wanting to centrally manage and protect their critical data in the data center, in remote offices and across platforms. It enables a single management solution across hybrid IT environments including tape, cloud, hardware and virtualized storage. Data Protector's strength is in its ability to perform backup and restore across a wide range of data and storage types, but these tasks can be enhanced and simplified by utilizing complimentary products within the Micro Focus IT Operations Management (ITOM) suite of products.

These advanced solutions from Micro Focus can help customers assess and modernize their Data Protector environment to meet their current data protection requirements.

Data Protector is certified with the major mission critical applications and integrated with main storage vendors for secure enterprise backup and recovery.

The Data Protector Advantages

- **Business Value Dashboard (BVD)** Integration released with Data Protector 10.03 (March 2018); see [announcement](#) blog.
 - BVD brings forward key backup and recovery KPIs to provide a fast and easy overview of backup success rates for executives and managers on the move.
 - Business executives or admins on the move can monitor a geographically dispersed, distributed DP deployment between meetings or during travel.
 - **Operations Orchestration (OO)** Integration Released with Data Protector 10.04 (May 2018); see the [announcement](#) blog.
 - By automating various functions across teams, tools, technologies, and environments, OO breaks down silos, integrates with anything, and orchestrates any process.
- We offer OO workflows to automate routine tasks such as provisioning clients, managing and monitoring Data Protector services or daemon, running file system backup and restores, getting session details, and aborting active sessions.
 - ITOM customers who already own OO can download the latest content pack that includes Data Protector Workflows from the [ITOM Marketplace](#).
 - Data Protector integration with **Hybrid Cloud Management (HCM)** enables automation of the protection of your deployed systems with a single mouse click protecting your cloud workloads.
 - Data Protector can effectively backup the ITOM product set to meet SLA and compliance requirements.
