

# Micro Focus Storage Manager

Exponential storage growth, storage compliance and unstructured file storage cannot be adequately addressed through a manual storage management process. Put an end to manual storage provisioning, archiving, disposition and other tasks while providing structure and assurance of storage compliance through identity-driven, policy-based automation for your Micro Focus Open Enterprise Server network..

## Storage Manager at a Glance:

### ■ Automated File Management:

Automated policy enforcement about where files go, what kinds of files users store and what files need to be removed.

### ■ Identity-Based Access Control:

Assure that users have the correct access permissions according to user identity and role.

### ■ Storage Distribution and Migration:

Distribute and migrate files and folders quickly, easily and without hindering user productivity

**"Micro Focus Storage Manager is the single greatest product I've ever used."**

#### BRIAN VERKAMP

IT Director  
University of Cincinnati College of Education

## Storage Growth

Network data storage is growing at an unprecedented, exponential rate. Factors in this growth include:

- Compliance with industry and government regulations for retention, security and integrity
- Pervasive computing devices in a "keep-everything culture"\*
- The availability of relatively low-cost storage devices where data is often offloaded without much thought or planning
- Understaffed corporate IT departments using manual storage management methods that simply cannot keep pace with today's network storage needs

But what if you could automate your storage management tasks so that storage for network users and groups was provisioned when needed, distributed and migrated when storage was nearing capacity, cleaned up on a regular basis and much more? In other words, what if you could automate the full lifecycle of network user and group storage from home folder creation to archiving or disposal, along with the normal day-to-day maintenance associated with this storage?

## Introducing Micro Focus Storage Manager

Directory events trigger actions that Storage Manager takes according to policies. Policies can specify:

- Where to create user home folders and group storage folders, what specific files

to provision inside the folders, along with the rights and storage quota settings

- Where to move home folders and what rights and quota to modify when a user is moved in the directory
- Unallowable file types (such as media files) that are to be "groomed" from home folders and group storage
- What files to keep and what files to dispose of when a user leaves an organization

Once an event takes place for which there is an associated policy task, Storage Manager performs the task automatically—according to the policy. Through its strict enforcement of policies, Storage Manager assures that compliance for storage retention, security and access is enforced.

## Storage Distribution and Migration

File system storage growth often requires that home and group folders be moved to larger disk systems on larger servers. With Storage Manager, distributing and migrating this storage is quick and easy. Simply indicate the destination for the storage, and Storage Manager can initiate the data distribution or migration while working around users that may be logged in to the network. A large state university used Storage Manager to migrate 70,000 students from one data center to another with no loss of productivity or downtime.

### **Secure User Access to Stored Data**

As an identity-based product working with NetIQ eDirectory, Storage Manager grants and restricts user and group access to network storage areas based on user identity and role. This assures that users and group members have access to the network folders they need to do their work and that folders containing sensitive files are restricted to only those users who are authorized to access them.

### **Substantial Return on Investment**

Automation of storage-related tasks through Storage Manager can save a substantial amount of money over time. Consider, for example, a mid-size company with 10,000 users and servers dispersed across multiple offices. Monthly, they average 200 user-move requests that require IT personnel to update network and accounts and manually move storage to new destination servers. Now, they've automated that process and realized significant savings.
