

Data Center Automation

Automate enterprise-scale provisioning, patching, and compliance across multi-vendor physical and virtual servers, databases, and middleware for enterprise-scale deployments.

Micro Focus® Data Center Automation (DCA) suite is a unified, analytics-driven infrastructure management solution that automates tasks, orchestrates IT processes, enforces compliance, and optimizes infrastructure.

■ **Provisioning, patching, and compliance across the data center:**

Labor-intensive IT compliance management activities increase compliance costs. DCA eliminates complexity, reduces costs, and improves security. Break down silos with industry-best orchestration. Automate regulatory and patching compliance through a single UI with out-of-the-box compliance content, closed-loop remediation, and single-view risk dashboards.

60% Less time on compliance processes¹

- **Integrated compliance and patching in a single UI:** Server application downtime impacts business continuity and availability. DCA enables you to detect and remediate vulnerability and compliance risks across servers, databases, and middleware. Proactively manage to objectives with closed-loop remediation and exception handling.

64% Server downtime reduction¹

- **Single-view compliance and risk dashboards:** See and manage regulatory compliance risks, vulnerabilities, security patch status, and age of vulnerabilities across the data center in one place.
- **Provision modern workloads:** Process workflow design and editing is labor intensive and requires highly specialized resources. With DCA, you can automate deployment and orchestration for Docker-based Kubernetes clusters with master and worker nodes. Built-in templates provision and configure container infrastructure.

85% Less process scripting time¹

- **Market-leading, out-of-the-box content:** Choose from ready-to-go OS build plans; patch bundles; orchestrated flow; compliance benchmarks for CIS, PCI-DSS, SOX, FISMA, and HIPAA; security content; and remediation actions.
- **End-to-end IT process orchestration:** Orchestrate provisioning, patching,

compliance, and remediation for end-to-end integration across the data center.

- **Provisioning at global scale:** Server configuration and provisioning is too complex. DCA enables you to provision across physical and virtual servers, OS, databases, and middleware at enterprise scale and heterogeneity.

60% Server management time reduction¹

“HPE Server Automation (now Micro Focus Data Center Automation) makes it easy for many teams to pick and start managing a large environment. Being able to automate repeated tasks greatly reduced manual errors and allowed us to push more out at one time.”

PATRICK KERNAN

IT Vice President
Riverturn, Inc.

Proof Points

- TEB realized **98% reduction** in the time taken to **deliver package deployments**
- Verizon **deployed Universal Discovery to 10,000 servers over six weeks** versus nine months
- UBS AG **deployed patches** within **one week** versus four to six weeks and **reduced manual procedures** by about **90%**, increasing labor productivity and eliminating human errors
- Sunguard improved **test success rate** to **90%** (vs. industry average of 35%)
