

Fortify Software Security Center, Ecosystem and Tools

Fortify offers the world's most comprehensive static and dynamic security testing platform, powered by our industry-leading security research.

Fortify solutions can be deployed on-premise or as a service to build a scalable, agile application security program that meets the evolving needs of today's IT organization.

Fortify Software Security Center is an application security testing solution that identifies and prioritizes security vulnerabilities in software so that issues are fixed and removed quickly before they can be exploited by attackers.

What's New

- ScanCentral supports packaging and scanning solutions remotely (translation and analysis phases). This helps centralize scanning efforts without adding additional load to the build and release servers.
- A new container is available on Fortify Docker. It includes detailed documentation for deploying and configuring Software Security Center via Helm charts to a Kubernetes cluster.
- ScanCentral is updated with the 2019 version of the CWE Top 25 to help prioritize security issues.
- Audit Assistant combines past audit data and machine learning to automatically triage security issues with up to 98% accuracy. Audit Assistant is available as a cloud-based service to both Fortify on Demand and Fortify on-premise customers, and as a completely on-premise option to bring the entire Audit Assistant stack to your premises.

- Security Assistant provides immediate feedback at developer IDE about vulnerabilities on code as it is being developed in Visual Studio and Eclipse.
- Fortify ScanCentral enables lightweight packaging on the build server, and provides a scalable, centralized, Fortify scanning infrastructure to meet the growing demands of modern development needs from within Fortify Software Security Center.
- Fortify SSC added capabilities to its GUI. The new features provide an improved comprehensive view of applications and scans.
- Github (www.github.com/fortify) repository provides sample integrations and code

Did You Know?

- Audit Assistant can be easily automated with SSC's automatic prediction and apply feature to help audit security issues at scale.
- Many important product usage tips are available via [Fortify Unplugged Videos](#). Additionally important tools and integrations can be accessed via the [Fortify Marketplace](#).
- Subscribe to the [Fortify Product Announcement board](#) today to stay up to date on what's new with our products!

PARKEON

"Fortify has helped us establish secure development practices based on its analysis of our software security architecture and application code."

"We work extremely hard to ensure the highest levels of security, and Fortify has enabled us to add one more element to our overall program."
