

ZENworks Configuration Management

ZENworks® Configuration Management helps organizations to automate and enforce IT management processes across the lifecycles of all devices in physical and virtual environments. With ZENworks, organizations get a complete Unified Endpoint Management solution that helps them create automated policies to manage devices according to identity, location, and role in any server environment IT chooses.

"ZENworks has given us an agility we didn't have. As an IT department we were reactive and it felt like in constant firefighting mode. Now, our increased efficiency allows us to be much more proactive and think about how we add value for our users. We made changes to our helpdesk management which has transformed the perception of IT within the company."

BENJAMIN HARE
Network Support Technician

What's New Over the Last 2 Years

- **Unified Endpoint Management** means you can manage your iOS and Android devices in the same way you manage your Windows devices. Capabilities like Apple's DEP and VPP, Android Enterprise Work Profile and Work Managed allow you to leverage the power of MDM capabilities for lifecycle management of devices without significant retraining.
- **Actionable Dashboards** give you a modern way to visualize important aspects of the zone, customize the views and take action when action needs to be taken.
- **Improved imaging support for the latest hardware and deployment methods** means you can use a Windows PE environment for taking and deploying images in addition to the SUSE Linux-based environment. We also integrate with

the Microsoft Deployment Toolkit, allowing the use of industry standard deployment tools in conjunction with ZENworks to deploy Windows 10.

- Our **SIEM Integration** allows ZENworks to provide audit and messaging events to your SIEM solution (such as ArcSight), offering important security indicators such as failed remote control attempts, failed logins, and more.

Did You Know?

- We add many customer ideas as features with each release. Recent additions include **IPv6 support, Bundle Install Schedules, automated checking and deployment of Product Recognition Updates**, the ability to **import network devices from CSV** and attach them to Asset Management contracts, and more.
