Fortify Insight

Fortify Insight is an Application Security Posture Management platform that aggregates data from SAST, DAST, Pen Testing, and more, enabling AppSec professionals to make meaningful improvements in their security posture.

Product Highlights

- Fortify Insight is an Application Security Posture Management platform for aggregating and correlating application security data with organizations' software asset inventories to help manage software risk across multiple vectors: SAST, DAST, SCA, container-based security and penetration test results.

- Advanced AppSec reporting allows Cyber Executives, VPs of Development, Cyber Risk Managers, Developers and AppSec Teams to prioritize what's most important in their application security posture.

- Fortify Insight drastically reduces time, effort, and financial burden by having a single pane of glass to integrate into the target sources to see results & recommendations to streamline the process.

Key Benefits

Clearly Identify and Communicate Enterprise-Wide Application Security Risk
Fortify Insight gives enterprises the means to truly manage their AppSec programs by:

- Clearly identifying application security risk and providing health, risk, and compliance visibility across the entire enterprise in a way no other solution can match.

- Reducing enterprise risk throughout the application development lifecycle.

- Highlighting trends across applications and prioritizing the most threatening vulnerabilities.

- Reducing time spent compiling reports with centralized management and automated aggregation across multiple tests, testers, and tools.

Capabilities

- **Configurable User Experience**
  Focus on what's most important, while enjoying the benefits of modern advanced filtering, API access, and more.

- **Historical Trend Insights**
  Take advantage of key insights into scans and vulnerability trends.

- **Scalable AppSec Management**
  Provide access to a vast amount of AppSec users, while keeping optimal performance with rapid response time.

- **Data Access**
  View your data any way you want with features such as powerful query language, data normalization, and API access.
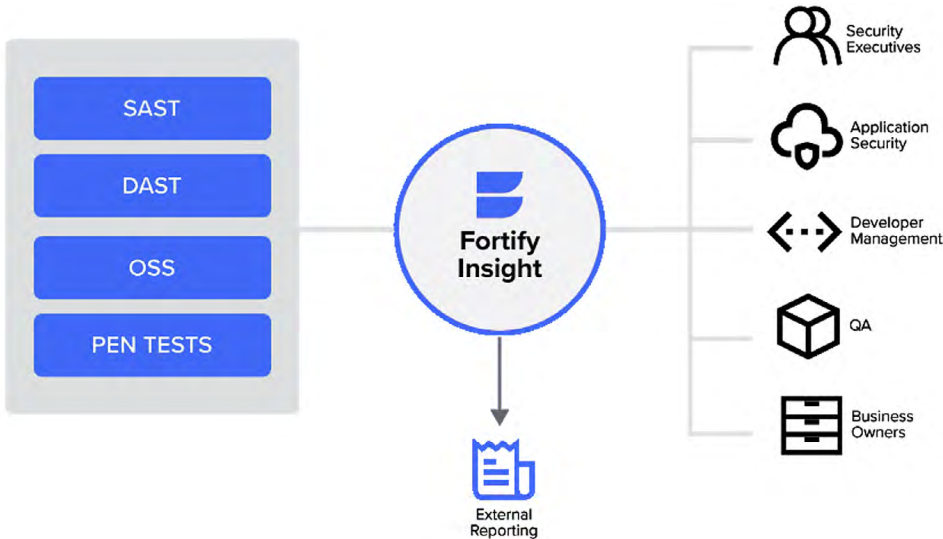

- Delivering information in standardized reporting that eliminates formatting and tool conflicts with automated data normalization.
- Contextualizing application security data with business context to enrich the data to streamline the process.
- Eliminating the cost, risk, and manual resources associated with traditional tool and application data comparison.
- Extending the value of current security investments by providing a common database.

Make Data-Driven Decisions
Fortify Insight provides a clear picture of application risk across the entire enterprise and lets every team from the board room to engineering make data-driven decisions based on clear and precise information. Fortify Insight provides the visibility into enterprise-wide application security risks that enables accurate decision making with:

- Instant snapshot views of your current enterprise-wide application security posture.
- Clear identification of issues, risks, and remediation.
- Data consistency, e.g., ensuring that "critical" and other vulnerability categories are defined the same way across tools and testers.
- Trend reporting that shows how your application security risk is changing over time.
- Increased data visibility.
- Improved efficiency and productivity.
- Ongoing assessment and compliance validation.
- Data enrichment with application of business context and insight with vulnerability information.

Manage Results Instead of Reports
Pen testers and AppSec teams spend too much time creating reports that must resolve conflicting data formats and combine results from different testers, tests, and tools. More importantly, reporting problems make it that much harder to communicate a true picture of risk to every stakeholder who needs to understand it. That includes every audience, from the executives responsible for risk and branding to the developers who build the applications.

Focus on results, not formatting.

- Simplify report management, creation, and delivery.
- See trends to prove compliance with results and show how applications are tested.
- Ensure compliance with application testing being done with the right technology at the right time in the right order.

Key Features
Fortify Insight:

- Provides true observability across your entire enterprise application risk with pinpoint clarity and understanding.
- Gives full insight into enterprise-wide vulnerabilities with high level trending and executive dashboards that immediately convey the current state of risk across the entire enterprise.
- Simplifies report creation and communication by standardizing and normalizing data formats across incompatible tools and applications.
- Extends the value of your current application security investments by reconciling their incompatibilities and presenting a single pane of view for your entire AppSec program.
- Enriches vulnerability data by adding business context and value.
