MICRO FOCUS®

Enable Continuous Delivery with DevOps-Driven Cloud Management

The Micro Focus® Hybrid Cloud Management (HCM) suite combines continuous delivery and release automation with hybrid cloud management and IT process automation for DevOps-driven organizations that want to deliver applications to any cloud, any environment and any technology.

Better Together: Hybrid Cloud and Continuous Delivery

In the age of technology-empowered customers, the timing and quality of your applications can make or break you. To be competitive, you need to deploy applications faster and deliver new features more consistently. However, many current release management and deployment processes are still manual and prone to error.

Designed to support proven DevOps tenets such as collaboration, continuous delivery, deployment automation, and frequent updates—HCM helps enterprises accelerate time to market for applications and deliver high levels of customer responsiveness.

Key Benefits

Faster Time to Market
To accelerate response times you have to eliminate those manual, error-prone tasks. HCM provides the automation tools and capabilities required for complex multi-tier application release management and deployment across the application lifecycle.

More Accurate Fulfillment
Accuracy begins with your models. HCM models infrastructure and application components separately. This unique approach increases accuracy of release deployment by allowing components to be matched based on application requirements at the time of deployment.

Increased Efficiency and Collaboration
Developers who spend less time troubleshooting have more time to innovate. HCM frees up time by using the same application deployment models for consistent, repeatable deployments across different stages of the application pipeline.

Out-of-Box Integration across DevOps Tool Chain
HCM protects your current tool, content, and service investments. Out-of-the-box integrations with Jenkins, TFS, Bamboo, Chef, Puppet, VMware, Amazon, Azure, and many others allows you to use existing templates and configurations. HCM also provides open, documented APIs to support custom integrations, so your tools of choice can be used throughout the application lifecycle.
