## Third Party Systems

The software is designed to run in an environment containing third party elements meeting certain prerequisites. These may include operating systems, directory services, databases, and other components or technologies. See the accompanying prerequisites list for details.

The software may require a minimum version of these elements in order to function. Further, these elements may require appropriate configuration and resources such as computing, memory, storage, or bandwidth in order for the software to be able to perform in a way that meets the customer requirements. The download, installation, performance, upgrade, backup, troubleshooting, and management of these elements is the responsibility of the customer using the third party vendor's documentation and guidance.

Third party systems emulating any these elements must fully adhere to and support the appropriate APIs, standards, and protocols in order for the software to function. Support of the software in conjunction with such emulating third party elements is determined on a case-by-case basis and may change at any time.

| 5.4.16 | srs.sid_text                   | 115 |

# About This Guide

- ◆ [Chapter 1, “Updates and Breaking Changes,” on page 7](#)
- ◆ [Chapter 2, “Supported Constructs,” on page 9](#)
- ◆ [Chapter 3, “Navigating Scan Data,” on page 15](#)
- ◆ [Chapter 4, “Example Scenarios,” on page 27](#)
- ◆ [Chapter 5, “Schema Reference,” on page 39](#)

The Custom Query guide is written to provide guidance for the development of SQL queries for use with Custom Query reports in File Reporter 4.1.

## Audience

This guide is intended for network administrators and report developers responsible for developing SQL queries for use with Custom Query reports in File Reporter 4.1.

## Feedback

We want to hear your comments and suggestions about this manual and the other documentation included with this product. Please use the User Comment feature at the bottom of each page of the online documentation.

## Documentation Updates

For the most recent version of the *Micro Focus File Reporter 4.1 Database Schema and Custom Queries Guide*, visit the [Micro Focus File Reporter Documentation Web site](#).

## Additional Documentation

For additional Micro Focus File Reporter documentation, see the following guides at the [Micro Focus File Reporter Documentation Web site](#):

- ◆ [Micro Focus File Reporter 4.1 Installation Guide](#)
- ◆ [Micro Focus File Reporter 4.1 Administration Guide](#)
- ◆ [Micro Focus File Reporter 4.1 Client Tools Guide](#)

## Documentation Conventions

In this documentation, a greater-than symbol (>) is used to separate actions within a step and items in a cross-reference path.

When a single pathname can be written with a backslash for some platforms or a forward slash for other platforms, the pathname is presented with a backslash. Users of platforms that require a forward slash, such as Linux\*, should use forward slashes as required by your software.

When a startup switch can be written with a forward slash for some platforms or a double hyphen for other platforms, the startup switch is presented with a forward slash. Users of platforms that require a double hyphen, such as Linux, should use double hyphens as required by your software.

# 1 Updates and Breaking Changes

- ♦ [Section 1.1, “Updates,” on page 7](#)
- ♦ [Section 1.2, “Breaking Changes,” on page 7](#)

## 1.1 Updates

### 1.1.1 Additional Schema for Microsoft 365

Supported schema for extended Microsoft 365 SharePoint Online data has been added with this release.

A new set of SharePoint-specific tables have been added for improved analysis of permissions in OneDrive for Business and SharePoint Online document libraries.

The new set of tables includes:

- ♦ ms365.sp\_base\_permissions
- ♦ ms365.sp\_group\_members
- ♦ ms365.sp\_groups
- ♦ ms365.sp\_permission\_levels
- ♦ ms365.sp\_permissions
- ♦ ms365.sp\_site\_permissions
- ♦ ms365.sp\_users

In addition, supported references for SharePoint identifiers have been added to the ms365.permissions table:

- ♦ grantedto\_sp\_user\_id
- ♦ grantedto\_sp\_group\_id
- ♦ grantedto\_sp\_login\_name
- ♦ site\_collection\_id

## 1.2 Breaking Changes

- ♦ [Section 1.2.1, “Deprecated Views,” on page 8](#)
- ♦ [Section 1.2.2, “Removed Tables,” on page 8](#)
- ♦ [Section 1.2.3, “Removed Columns,” on page 8](#)

## 1.2.1 Deprecated Views

The following views are deprecated as of File Reporter 4.0 in favor of their corresponding generic view names:

- ♦ `srs.current_fs_scandata_ad`
- ♦ `srs.previous_fs_scandata_ad`
- ♦ `srs.baseline_fs_scandata_ad`

Please use the following views instead, as the \*\_ad views are subject to removal in a later release:

- ♦ `srs.current_fs_scandata`
- ♦ `srs.previous_fs_scandata`
- ♦ `srs.baseline_fs_scandata`

## 1.2.2 Removed Tables

The `ms365.site_drives` table has been removed as of File Reporter 4.1.

The `ms365.drives` table now include a `site_id` reference column that replaces the need for this bridge table.

Upgrading from File Reporter 4.0 to 4.1 automatically extends this table and populates the corresponding new reference column using the legacy `ms365.site_drives` table before dropping it.

---

**IMPORTANT:** Any Custom Queries that reference the legacy `ms365.site_drives` table will need to be updated to make use of the new `ms365.drives.site_id` column instead.

Any queries that continue to reference the legacy table will no longer work after upgrading to File Reporter 4.1 or later until this change has been made.

---

## 1.2.3 Removed Columns

The `grantedto_id_type` string-typed column in the `ms365.permissions` table has been removed as of File Reporter 4.1.

A replacement column `grantedto_type` has been added which is an integer type representing a discrete enumeration.

# 2 Supported Constructs

- ◆ [Section 2.1, “Supported Schema Objects,” on page 9](#)
- ◆ [Section 2.2, “Schema Namespaces,” on page 9](#)
- ◆ [Section 2.3, “Supported Tables,” on page 10](#)
- ◆ [Section 2.4, “Supported Views,” on page 12](#)
- ◆ [Section 2.5, “Supported Functions,” on page 12](#)

## 2.1 Supported Schema Objects

The supported database schema objects include entries in the following categories:

- ◆ Identity Systems – system name, users, groups, other security principals
- ◆ Windows File System – file system meta data, permissions
- ◆ File Content Analysis Data – data related to discovery of search expressions over file content
- ◆ Microsoft 365 Data – data related to drives, drive items and supporting meta data and permissions as well as basic teams and sites info in Microsoft 365

Although any tables, views, stored procedures and functions in the database can be accessed via custom queries, only the tables, views, and functions listed here are supported for use with Custom Query development.

---

**IMPORTANT:** Users who are new to SQL may find the supported views easier to start with as each view provides a simple presentation of several key tables. In addition, the `current_*` views are pre-filtered for only the most recent scan data.

More experienced users may find performance benefits from making direct inline queries against the tables themselves, especially for complex queries.

---

## 2.2 Schema Namespaces

All supported database objects and functions reside in specific schema namespaces. For example, the distinguished name for the table `scan_data` would be referenced as `srs.scan_data` when using the namespace prefix.

Although use of the namespace prefix is not required in all cases, there are some cases where it is required, such as when referencing a user defined function in Microsoft SQL Server, or when another database object of the same name exists in the schema search path. For these reasons you should always reference each supported database object and function with its documented namespace prefix.

The following table lists the namespaces containing database objects supported for use with custom SQL queries.

**Table 2-1** Schema Namespaces

| Schema Name | Notes  |
|-------------|--|
| ad          | Contains the Active Directory identity data structures                                     |
| analysis    | Contains file content analysis data structures   |
| ms365       | Contains Microsoft 365 data structures and functions                                       |
| srs         | Primary namespace containing all file system data structures as well as general functions. |

## 2.3 Supported Tables

**Table 2-2** Supported Database Tables

| Category              | Table Name                 | Notes  |
|-----------------------|----------------------------|--|
| Windows File System   | srs.identity_systems       | List of all identity systems.                                      |
|                       | srs.ad_objects             | List of all scanned Active Directory security principals           |
|                       | srs.ad_memberships         | Active Directory group memberships                                 |
|                       | srs.scan_targets           | List of all configured scan targets (volumes, shares, etc.)        |
|                       | srs.scans                  | List of all available scans  |
|                       | srs.scan_history           | Historical scan summary records                                    |
|                       | srs.scan_data              | All scan data – includes all path and file-specific metadata info  |
|                       | srs.scan_directory_data    | All directory-specific scan data                                   |
|                       | srs.trend_volume_freespace | List of all volume free space records                              |
|                       | srs.ntfs_aces              | Scanned NTFS ACEs  |
| Active Directory      | srs.security_descriptors   | Scanned NTFS security descriptors                                  |
|                       | ad.domain                  | List of scanned Active Directory domains in the forest             |
| Active Directory      | ad.ds_objects              | List of scanned security principals in the Active Directory forest |
|                       | ad.ds_objects              | List of scanned security principals in the Active Directory forest |
| File Content Analysis | analysis.file_scan_entries | Summary classification data for file content analysis entries      |
| Microsoft 365         | ms365.drive_items          | Files and folders in drives, document libraries                    |
|                       | ms365.drive_item_types     | Enumeration table of drive item types                              |
|                       | ms365.drive_scans          | List of scans against MS365 drives                                 |

| Category | Table Name                 | Notes  |
|----------|----------------------------|--|
|          | ms365.drive_scans_history  | Historical summary of drive scans  |
|          | ms365.drives               | List of MS365 drives (document libraries, OneDrive for Business drives)                    |
|          | ms365.group_drives         | Mapping of MS365 groups (teams) to associated drives                                       |
|          | ms365.group_member_types   | Enumeration table of group member types  |
|          | ms365.group_members        | MS365 group membership associations  |
|          | ms365.group_owners         | MS365 group owner associations   |
|          | ms365.group_sites          | Mapping of MS365 groups (teams) to associated sites  |
|          | ms365.groups               | List of discovered MS365 groups  |
|          | ms365.identity_types       | Enumeration table of identity types  |
|          | ms365.jobs                 | List of jobs to enumerate MS365 tenant objects (teams, sites, groups, users, drives, etc.) |
|          | ms365.jobs_history         | Historical summary of tenant scans   |
|          | ms365.permissions          | Sharing links and direct access permissions for drive items                                |
|          | ms365.sharing_link_members | List of security principals associated with a specific sharing link                        |
|          | ms365.sites                | List of discovered MS365 SharePoint sites  |
|          | ms365.sp_base_permissions  | Lookup table for SharePoint permission levels / roles.                                     |
|          | ms365.sp_group_members     | SharePoint group member associations   |
|          | ms365.sp_groups            | List of SharePoint groups  |
|          | ms365.sp_permission_levels | List of SharePoint permission levels / roles   |
|          | ms365.sp_permissions       | List of SharePoint permissions (assigned permission levels)                                |
|          | ms365.sp_site_permissions  | List of SharePoint site permissions  |
|          | ms365.sp_users             | List of SharePoint users   |
|          | ms365.team_channels        | List of discovered Teams Channels  |
|          | ms365.teams                | List of discovered MS365 Teams   |
|          | ms365.tenants              | Configured MS365 tenants for scan  |
|          | ms365.user_drives          | Mapping of MS365 users to drives (OneDrive for Business drives)                            |
|          | ms365.users                | List of discovered MS365 users   |

| Category         | Table Name      | Notes   |
|------------------|-----------------|---|
| Session Specific | tmp_cq_fs_paths | Temporary table injected into custom query sessions for report-defined target paths |

## 2.4 Supported Views

*Table 2-3 Supported Database Views*

| Category            | View Name                      | Notes  |
|---------------------|--------------------------------|--|
| Windows File System | srs.current_fs_scans           | List of Current file system scans  |
|                     | srs.current_permissions_scans  | List of Current permissions scans  |
|                     | srs.previous_fs_scans          | List of Previous file system scans   |
|                     | srs.previous_permissions_scans | List of Previous permissions scans   |
|                     | srs.baseline_fs_scans          | List of Baseline file system scans   |
|                     | srs.baseline_permissions_scans | List of Baseline permissions scans   |
|                     | srs.current_fs_scandata        | List of all Current file system scan data  |
|                     | srs.previous_fs_scandata       | List of all Previous file system scan data   |
|                     | srs.baseline_fs_scandata       | List of all Baseline file system scan data   |
|                     | srs.current_ntfs_aces          | All Current permissions scan data for NTFS-compatible file systems   |
|                     | srs.previous_ntfs_aces         | All Previous permissions scan data for NTFS-compatible file systems  |
|                     | srs.baseline_ntfs_aces         | All Baseline permissions scan data for NTFS-compatible file systems  |
| Active Directory    | ad.ds_objects_view             | All primary properties from ad.ds_objects and ad.domains with binary GUIDs and SIDs converted to equivalent text variants. |

## 2.5 Supported Functions

*Table 2-4 Supported Database Functions*

| Category | View Name            | Description   |
|----------|----------------------|---|
| General  | srs.byte_string      | Converts raw number to byte string such as 10 MB or 3.25 KB           |
|          | srs.byte_unit_string | Converts raw number to byte string with specified unit and precision. |
|          | srs.attribute_string | Converts attributes to string representation                          |

| <b>Category</b>  | <b>View Name</b>             | <b>Description</b>   |
|------------------|------------------------------|--|
|                  | srs.guid_bytes               | Converts Guid from string to binary                          |
|                  | srs.guid_text                | Converts Guid from binary to string                          |
|                  | srs.path_hash                | Calculates SHA-1 hash of lowercase input (typically a path)  |
|                  | srs.path_hash_sha256         | Calculates SHA256 hash of lowercase input (typically a path) |
|                  | srs.bytes_to_hex_string      | Converts byte array to equivalent hex string                 |
|                  | srs.hex_string_to_bytes      | Converts hex string to equivalent byte array                 |
| Identity Systems | srs.sid_bytes                | Converts SID from string to binary                           |
|                  | srs.sid_text                 | Converts SID from binary to string                           |
|                  | srs.ad_account_name          | Combines AD account name elements into a single display name |
| Permissions      | srs.access_mask_basic_string | Converts access mask value to basic permissions string       |
|                  | srs.access_mask_string       | Converts access mask value to string representation          |
|                  | srs.ace_flags_string         | Translates ACE flag to string values                         |
|                  | srs.ace_type_string          | Translates ACE type to string value                          |
|                  | srs.ace_type_string          | Translates ACE type to string value                          |

# 3 Navigating Scan Data

- ◆ [Section 3.1, “Windows File System,” on page 15](#)
- ◆ [Section 3.2, “Active Directory Identities,” on page 24](#)

Writing queries that are both useful and accurate require a proper understanding of how to navigate collected scan data.

Due to the nature of how File Reporter collects and curates scan data, this section is broken up by resource type. In addition, it also provides guidance on how to report across these resource types in a single report query when applicable.

## 3.1 Windows File System

- ◆ [Section 3.1.1, “Table Relationships,” on page 15](#)
- ◆ [Section 3.1.2, “Scoping and Filtering,” on page 17](#)
- ◆ [Section 3.1.3, “File System Target Paths,” on page 21](#)

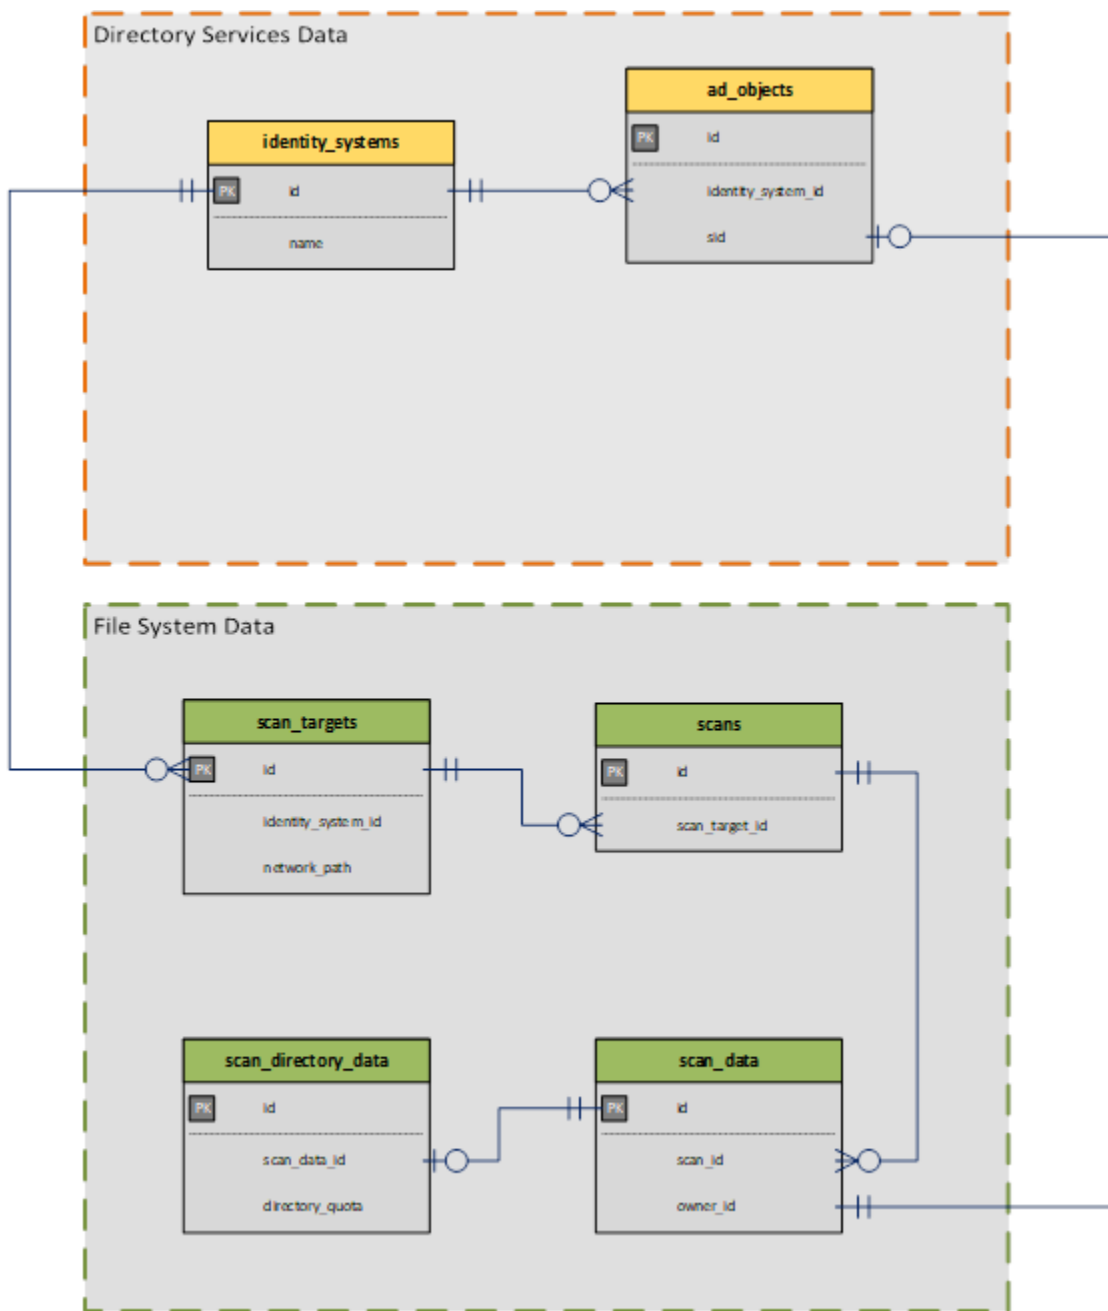

### 3.1.1 Table Relationships

- ◆ [“Windows File System Metadata” on page 15](#)
- ◆ [“Windows File System Permissions” on page 16](#)

#### Windows File System Metadata

The collected scan data is generally broken down into three major areas: Identity System info, File System data, and Permissions data.

For general file system metadata collection, only file system data is collected, along with minimal identity system data pertaining to file and folder owners.

## Windows File System Permissions

NTFS Permissions data is limited to folder structure as well as assigned and inherited NTFS access control entries (ACEs).

It should be noted that permissions scans do not include metadata specific information such as directory quota, nor do they include any file-entry data that is not a folder. Only permissions for folder, share, and DFS entries are currently collected.

### 3.1.2 Scoping and Filtering

- ◆ “Scope by Identity System” on page 17
- ◆ “Scope by Server” on page 18
- ◆ “Scope by Scan Target” on page 18
- ◆ “Scope by Directory” on page 19

Scoping is the process by which selected data is limited to areas of interest. Areas of interest may include all file system data related to a specific identity system, or only data within one or more subdirectories. Additionally, data could be scoped as it relates to a given owner or trustee.

#### Scope by Identity System

Scoping by identity system is as simple as limiting a query to a specific `srs.identity_system.id` value, or using one of the supported `srs.current_*` views, a specific identity system name.

The following example selects file system data from a given identity system, limited to 100 entries.

## Example (SQL Server)

```
1 | SELECT TOP(100) *
2 | FROM srs.current_fs_scandata
3 | WHERE identity_system = 'ad.test.lab';
```

## Example (PostgreSQL)

```
1 | SELECT *
2 | FROM srs.current_fs_scandata
3 | WHERE identity_system = 'ad.test.lab'
4 | LIMIT 100;
```

## Scope by Server

Scoping by server is as simple as filtering by the server column in the `srs.scan_targets` table or in one of the supported `srs.current_*` views.

Also note that the server name may be case sensitive depending on the database collation.

The following example selects all file system data from a specific server, limited to 100 entries.

## Example (SQL Server)

```
1 | SELECT TOP(100) *
2 | FROM srs.current_fs_scandata
3 | WHERE server = 'server1.ad.test.lab';
```

## Example (PostgreSQL)

```
1 | SELECT *
2 | FROM srs.current_fs_scandata
3 | WHERE server = 'server1.ad.test.lab'
4 | LIMIT 100;
```

## Scope by Scan Target

Scoping by scan target is useful where a specific CIFS share name or DFS target is known.

Note that the scan target name may be case sensitive depending on the database collation.

Example: Select file system data from a particular scan target (share or volume) limited to 100 entries.

## Example (SQL Server)

```
1 | SELECT TOP(100)
2 | *
3 | FROM srs.current_fs_scandata
4 | WHERE scan_target = '\\server1.ad.test.lab\Data';
```

## Example (PostgreSQL)

```
1 | SELECT
2 | *
3 | FROM srs.current_fs_scandata
4 | WHERE scan_target = '\\server1.ad.test.lab\Data'
5 | LIMIT 100;
```

## Scope by Directory

Scoping by a particular directory or folder requires the use of the hierarchical markers in the `srs.scan_data` table.

These markers assist with determining parent and child folders as well as all subordinate file system entries for a given directory or set of directories.

| Field   | Description   | Notes   |
|---|---|---|
| <code>idx</code>                                | Entry index.  | Unique per scan.  |
| <code>parent_idx</code>                         | Index of parent directory, share or DFS name space entry. | All sibling file system entries will have the same parent index.  |
| <code>path_depth</code>                         | Current path depth relative to root path.                 | The root path is always depth zero (0).<br><br>Other paths such as shares may have the same depth as the root path, but can be distinguished by <code>path_type</code> .<br><br>Entries occurring above the root path (such as DFS name spaces) will have a negative value. |
| <code>ns_left</code> ,<br><code>ns_right</code> | Nested set indexes for current entry.                     | Nested set markers provide a quick way to determine all subordinates for a given directory.<br><br>See examples below for detail.   |

The following example selects all NTFS file system entries subordinate to and including the specified target path.

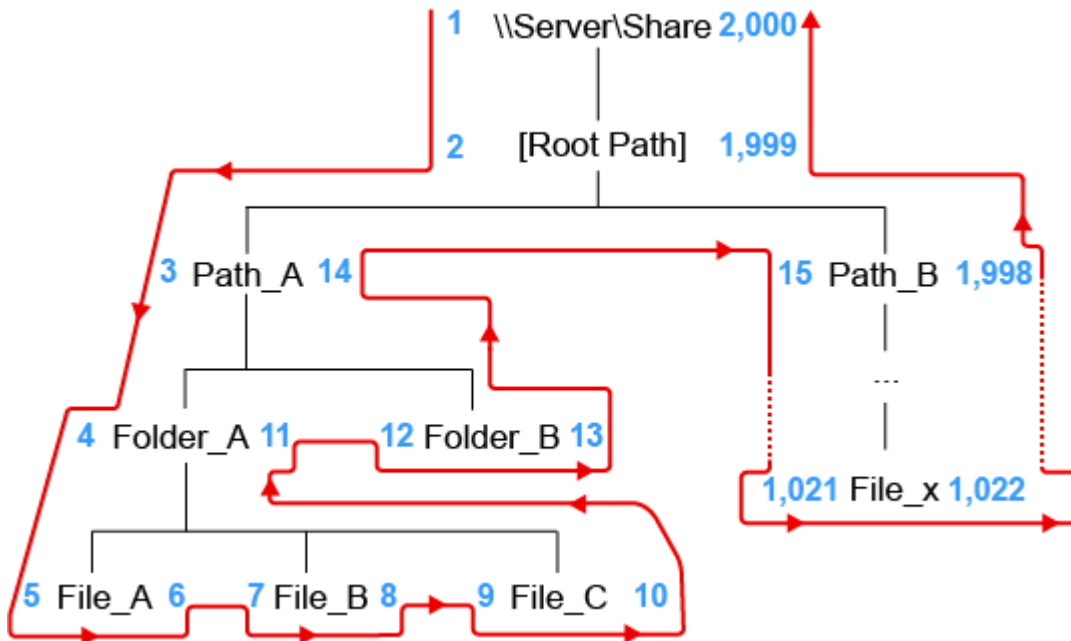

## Example: Scope by Directory

```
1 WITH root_path AS (  
2   SELECT  
3     sd.ns_left,  
4     sd.ns_right,  
5     sd.scan_id  
6   FROM srs.current_fs_scandata_ad AS sd  
7   WHERE sd.fullpath_hash = srs.path_hash('\\server1.ad.test.lab\Share\path\subpath')  
8     AND sd.path_type = 2  
9 )  
10 SELECT  
11   sd.*  
12 FROM srs.current_fs_scandata_ad AS sd  
13 JOIN root_path AS rp ON rp.scan_id = sd.scan_id  
14 AND rp.ns_left <= sd.ns_left  
15 AND rp.ns_right >= sd.ns_right;  
16
```

In this example, we are using two SELECT statements: one to get the information for the desired root path, and one to pull all subordinate entries along with the root path. Notice how the JOIN filter in the second SELECT statement uses not only the `scan_id` to limit the particular scan(s) of interest, but also uses the `ns_left` and `ns_right` fields to keep the data set limited to file entries in the folder hierarchy.

In the following diagram, an example of the nested set model calculations are shown with an example structure under `\\Server\Share`. In this example, exactly 1,000 file system entries exist, including files, folders, and the share itself.

*Figure 3-1 Nested Set Calculations Example*

For each node in the scanned file structure, a left (`ns_left`) and right (`ns_right`) value are assigned. The values are assigned by traversing the imaginary path from the root down the left side of the structure, incrementing the `ns_left` values by one. Once a leaf node is encountered, the incrementing value continues, but is now assigned to `ns_right`.

This process continues until the entire graph of the file structure has been traversed, and the root path is finally assigned the last number for its `ns_right` value.

The nested set model has the following characteristics, some of which are vital to hierarchical processing, such as determining subordinate objects:

- ♦ The root path will always have an `ns_left` value of 1 and an `ns_right` value of  $2n$ , where  $n$  = the total number of entries.
- ♦ For any given container object (folder, share, etc.), all subordinate entries can be found by searching for all objects in the scan having an `ns_left` value greater than the container path's `ns_left` value, and an `ns_right` value less than the container path's `ns_right` value.
- ♦ Nested set is generally the fastest method available in relational data models for retrieving all subordinate objects when representing hierarchical data.

For more information on the nested set model, see [http://en.wikipedia.org/wiki/Nested\\_set\\_model](http://en.wikipedia.org/wiki/Nested_set_model).

### 3.1.3 File System Target Paths

- ♦ [“Example Query” on page 21](#)
- ♦ [“Using Alternate SQL Query Editors” on page 22](#)

Starting with File Reporter 4.1, users may now define and manage a Custom Query report's selected target paths via the report definition itself, separate from any associated SQL queries.

This process is accomplished via a temporary table that is injected into the SQL query session at runtime when using any of the File Reporter tools such as Report Designer or the SQL query editor in the File Reporter web application for Custom Query reports.

Newer report templates available on the [File Query Cookbook](https://filequerycookbook.com) site (<https://filequerycookbook.com>) make use of this construct which provides a more hands-off approach for users not as comfortable with modifying SQL queries directly but who need the flexibility to define and change a report's file system target paths.

#### Example Query

To understand this process, the following example illustrates a custom query that reports on NTFS file system permissions for one or more target paths selected with the File System Target Paths dialog in Report Designer.

---

**IMPORTANT:** SQL Server requires a hash '#' prefix when referencing temporary tables.

When using SQL Server as the backend database, be sure that any references to `tmp_cq_fs_paths` in your SQL queries are changed to `#tmp_cq_fs_paths` instead.

Conversely, PostgreSQL cannot use hash marks '#' as part of the table name, so be sure that this prefix does not exist in your SQL queries when using PostgreSQL as the backend database.

---

- 1 Launch the File Reporter Report Designer application and create a new empty report.  
See [Creating a Report](#) in the *File Reporter 4.1 Client Tools Guide* for details.
- 2 Depending on the database in use, enter one of the following SQL queries into the SQL query editor dialog.

#### Example (SQL Server)

```
1 | SELECT
2 | *
3 | FROM srs.current_ntfs_aces AS ace
4 | JOIN #tmp_cq_fs_paths AS cq
5 | ON cq.target_path_hash = ace.fullpath_hash
6 | AND cq.is_current = 'true'
7 | AND cq.is_permission_scan = 'true';
```

#### Example (PostgreSQL)

```
1 | SELECT
2 | *
3 | FROM srs.current_ntfs_aces AS ace
4 | JOIN tmp_cq_fs_paths AS cq
5 | ON cq.target_path_hash = ace.fullpath_hash
6 | AND cq.is_current = 'true'
7 | AND cq.is_permission_scan = 'true';
```

- 3 Click **Save** to save the SQL query.
- 4 Click **File System Paths** to open the File System Target Paths dialog.
- 5 Select one or more paths to report on, then save the selection.  
Be sure to select paths that are marked as having Permissions scan data available as seen in the File System Target Paths dialog.
- 6 Click **Execute Query** to run the SQL query and see the results.

## Using Alternate SQL Query Editors

When developing a SQL query for a Custom Query report, you may wish to develop the query itself in a SQL query editor of your choice, such as SQL Server Management Studio (SSMS) or PgAdmin for PostgreSQL.

In these development environments, the injected temporary table is not available by default. To stage the temporary table, use the following approach.

---

**IMPORTANT:** Although any existing report definition may be used as a reference, we strongly advise creating a new Report Definition and using its associated ID.

This process allows flexibility for changing the selected target paths during the query design phase without impacting other report definitions.

- 1 Create a new Custom Query Report.  
See [Creating a Report](#) in the *File Reporter 4.1 Client Tools Guide*.
- 2 Assign one or more File System target paths to the report definition.  
See [File System Paths Selector](#) in the *File Reporter 4.1 Client Tools Guide*.
- 3 Find the report ID for the newly created report.

| Report Name   | Report Type  | Paths | Report Owner     | Last Modified     | Id |
|---|--------------|-------|------------------|-------------------|----|
| ntfs_aces in path   | Custom Query |       | sp\administrator | 3/1/2022 1:13:... | 68 |
| Extension report by category - summary                        | Custom Query |       | sp\administrator | 2/23/2022 2:17... | 45 |
| long path and filenames                                       | Custom Query |       | sp\administrator | 2/23/2022 1:39... | 37 |
| Copy Of long path and filenames                               | Custom Query |       | sp\administrator | 2/23/2022 1:38... | 67 |
| Group Memberships ms365                                       | Custom Query |       | sp\administrator | 2/23/2022 1:35... | 2  |
| Files created in the future, or modified before created       | Custom Query |       | sp\administrator | 2/23/2022 1:02... | 56 |
| FR 4.1 - Security2 - Disabled Inheritance on Department Share | Custom Query |       | sp\administrator | 2/21/2022 2:54... | 65 |
| FR 4.1 - Direct Folder Permissions with AD Attributes V1      | Custom Query |       | sp\m1-localadmin | 2/17/2022 2:08... | 57 |
| duplicate file - hash   | Custom Query |       | sp\administrator | 2/17/2022 1:36... | 3  |
| Extension report by category - detailed                       | Custom Query |       | sp\administrator | 2/15/2022 7:08... | 46 |
| Duplicate Files across Tenants                                | Custom Query |       | sp\administrator | 2/15/2022 6:53... | 14 |
| query builder   | Custom Query |       | sp\m1-localadmin | 2/11/2022 5:05... | 62 |
| test00  | Custom Query |       | sp\m1-localadmin | 2/11/2022 4:56... | 61 |
| Security - Users with Direct Access to Folders                | Custom Query |       | sp\administrator | 2/11/2022 4:04... | 50 |

- 3a In the Main form of the Report Designer, find the name of the newly created report definition.
- 3b The column at the far right of the grid indicates the ID for each report. Make note of the new report definition's ID number.
- 4 Insert the following SQL code at the start of the query.

**Example (SQL Server)**

```

1 IF OBJECT_ID('#tmp_cq_fs_paths', 'U') IS NULL
2 SELECT * INTO #tmp_cq_fs_paths
3 FROM srs.cq_fs_paths_by_report_id(17);

```

**Example (PostgreSQL)**

```

1 CREATE TEMP TABLE IF NOT EXISTS tmp_cq_fs_paths AS
2 SELECT * FROM srs.cq_fs_paths_by_report_id(17);

```

- 5 Be sure to change the example's report ID of "17" to the report ID identified from the previous step.
- 6 Add SQL statements as needed to complete the query.

- 7 When the SQL query development is complete, copy all of the SQL statements into the Custom Query report definition except for the initial lines used to stage the temporary table.

Using the example query from earlier, a complete query using a staged temporary table with an alternate SQL query editor looks as follows:

#### Example (SQL Server)

```
1  IF OBJECT_ID('#tmp_cq_fs_paths', 'U') IS NULL
2  SELECT * INTO #tmp_cq_fs_paths
3  FROM srs.cq_fs_paths_by_report_id(17);
4
5  SELECT
6  *
7  FROM srs.current_ntfs_aces AS ace
8  JOIN #tmp_cq_fs_paths AS cq
9  ON cq.target_path_hash = ace.fullpath_hash
10 AND cq.is_current = 'true'
11 AND cq.is_permission_scan = 'true';
```

#### Example (PostgreSQL)

```
1  CREATE TEMP TABLE IF NOT EXISTS tmp_cq_fs_paths AS
2  SELECT * FROM srs.cq_fs_paths_by_report_id(17);
3
4  SELECT
5  *
6  FROM srs.current_ntfs_aces AS ace
7  JOIN tmp_cq_fs_paths AS cq
8  ON cq.target_path_hash = ace.fullpath_hash
9  AND cq.is_current = 'true'
10 AND cq.is_permission_scan = 'true';
```

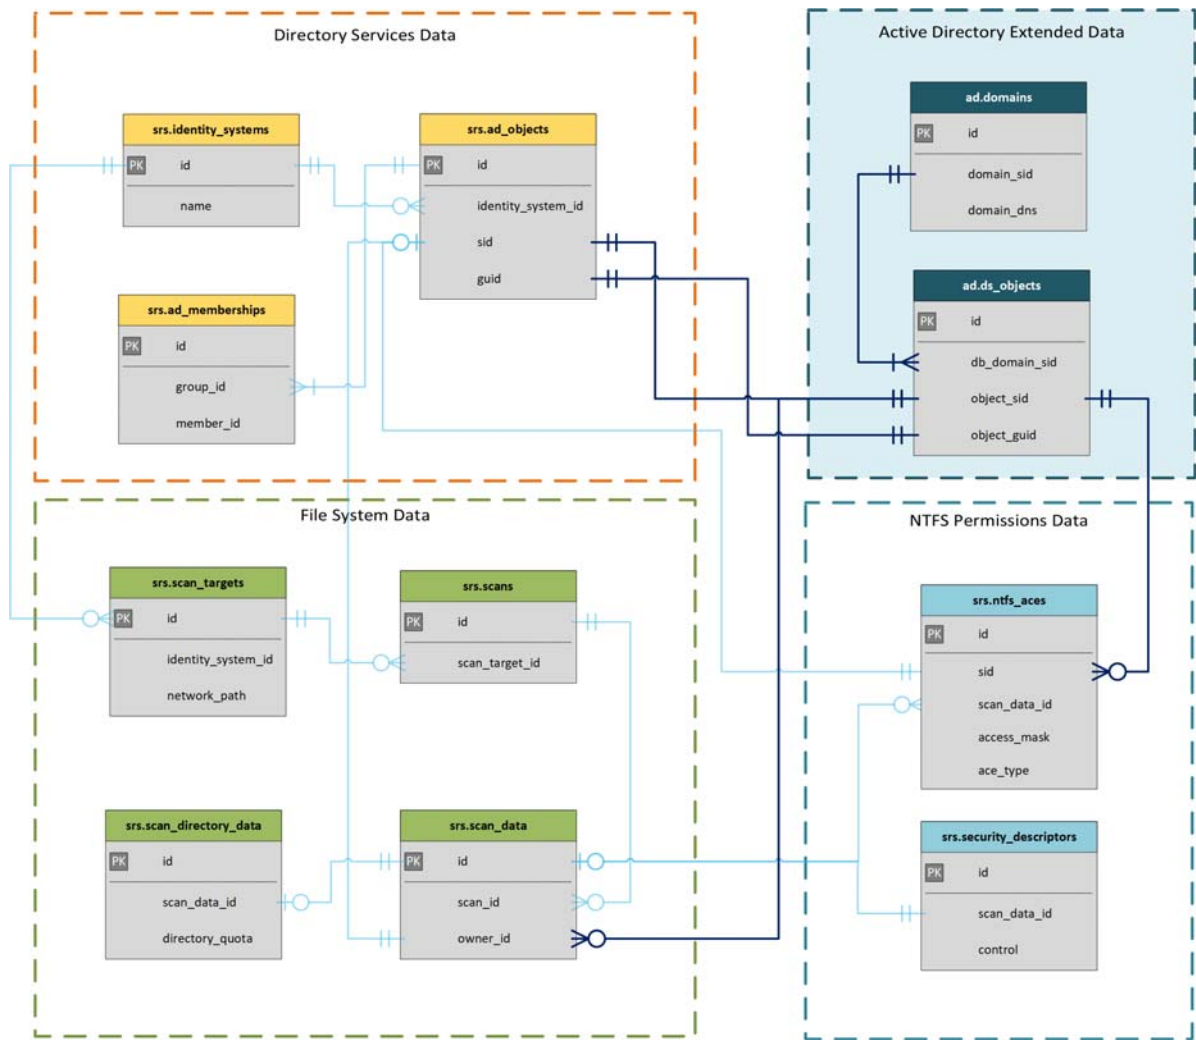

## 3.2 Active Directory Identities

The extended data for Active Directory identities is stored in the `ad.domains` and `ad.ds_objects` tables.

The tables used to map basic identity information for owners and permission trustees may be joined to these tables for extended information.

Note that while the current extended Active Directory information does not yet include group memberships, you may continue to use the existing group membership table `srs.ad_memberships` that identifies group members for discovered file system trustees.

For an example of integrating the extended Active Directory identity data in a Custom Query, see the example scenario

# 4 Example Scenarios

- ◆ [Section 4.1, “Content Has Duplicate File Reports,” on page 27](#)
- ◆ [Section 4.2, “Microsoft 365 Reports,” on page 31](#)
- ◆ [Section 4.3, “Active Directory Identity Enrichment,” on page 34](#)

## 4.1 Content Has Duplicate File Reports

- ◆ [Section 4.1.1, “Determining Prerequisites,” on page 27](#)
- ◆ [Section 4.1.2, “Designing the Report,” on page 28](#)

A Content Hashed Duplicate File report provides more advanced duplicate file detection over the Duplicate File built-in report which compares only filenames and metadata.

With the introduction of File Reporter 4.0, a new scanning option allows for Agents to produce a content based hash for specific files. These hashes can then be compared to identify duplicate files.

---

**NOTE:** For information on collecting content hashes, see [Creating a Scan Policy](#) in the *File Reporter 4.1 Administration Guide*.

---

Through <https://filequerycookbook>, you can copy and paste the Content Hashed Duplicate File Report custom query into the Query Editor and export a report layout into the Report Designer. This custom query and associated report identifies duplicate files based on hash comparisons and the parameters you set.

### 4.1.1 Determining Prerequisites

- ◆ Create a file system scan policy for each of the target paths on which you want to report.
- ◆ With the **Generate content file hashes** option selected in the Scan Policy Editor of each scan policy, conduct a file system scan on each target path.
- ◆ Install the Client Tools.  
The Client Tools include the Query Editor and the Report Designer that will be used in these procedures.
- ◆ Decide how you want the report to be generated and follow the applicable procedures.
  - ◆ To generate a delimited text file that you can take into other tools for customized searching and presentations, you can copy or create an SQL query with the query editor covered in [Creating a Report](#) in the *File Reporter 4.1 Client Tools Guide*.
  - ◆ To generate the report using the Report Designer and produce a formatted report layout, proceed with [Using the Report Designer](#) in the *File Reporter 4.1 Client Tools Guide*.

## 4.1.2 Designing the Report

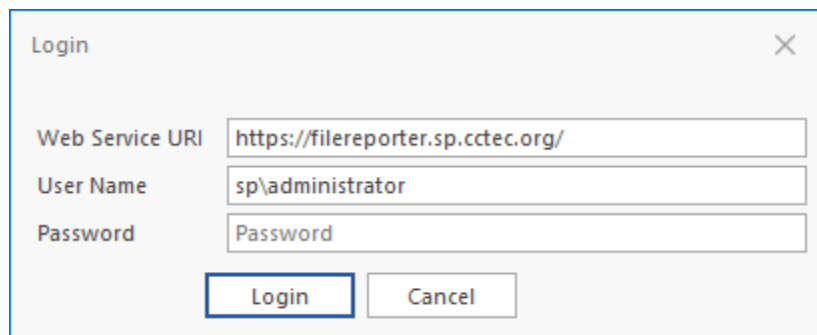

This option lets you utilize both the custom query *and* the associated report layout design for the “Content Hash Duplicate File Report” from <https://filequerycookbook.com>.

**NOTE:** A detailed discussion of the Report Designer, along with procedures for familiarizing yourself with the interface are available in [Using the Report Designer](#) in the *File Reporter 4.1 Client Tools Guide*.

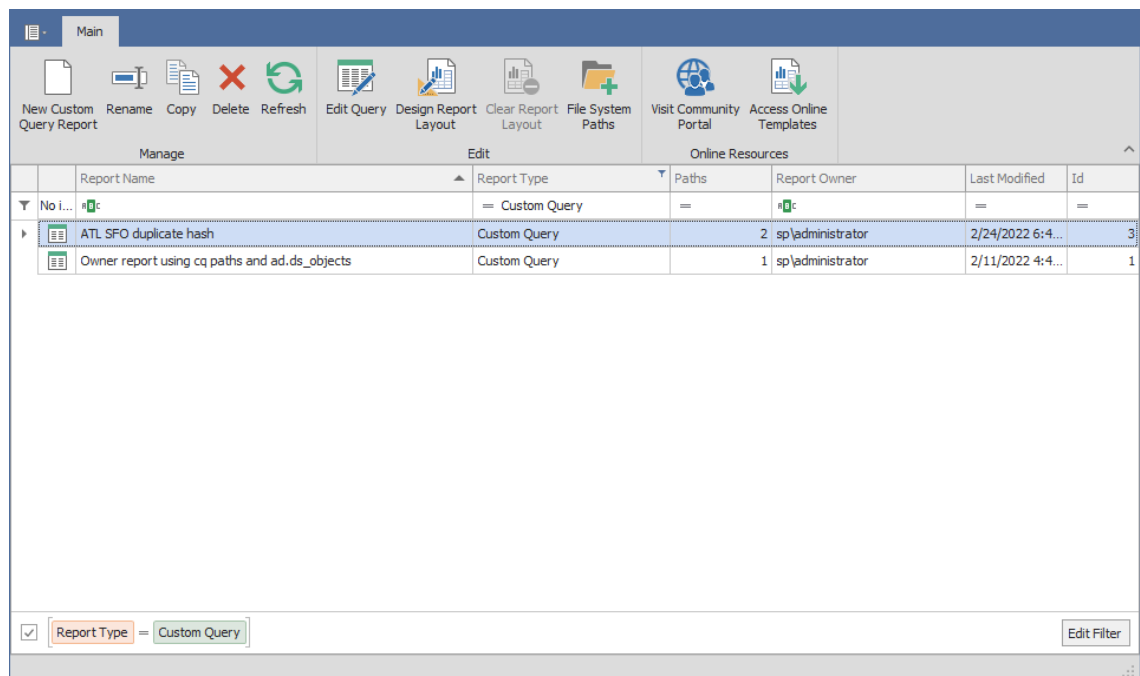

- 1 On the File Query Cookbook site at <https://www.filequerycookbook.com>, locate and download the “Content Hashed Duplicate File Report.”

The file is saved as zipped file.

- 2 Unzip the downloaded file and open the `.sql` file in a text editor.  
You will eventually paste this custom query into the Query Editor.
- 3 From the **Start** menu, launch the **File Reporter 4.1 Report Designer**.

- 4 Enter the login credentials and click **Login**.

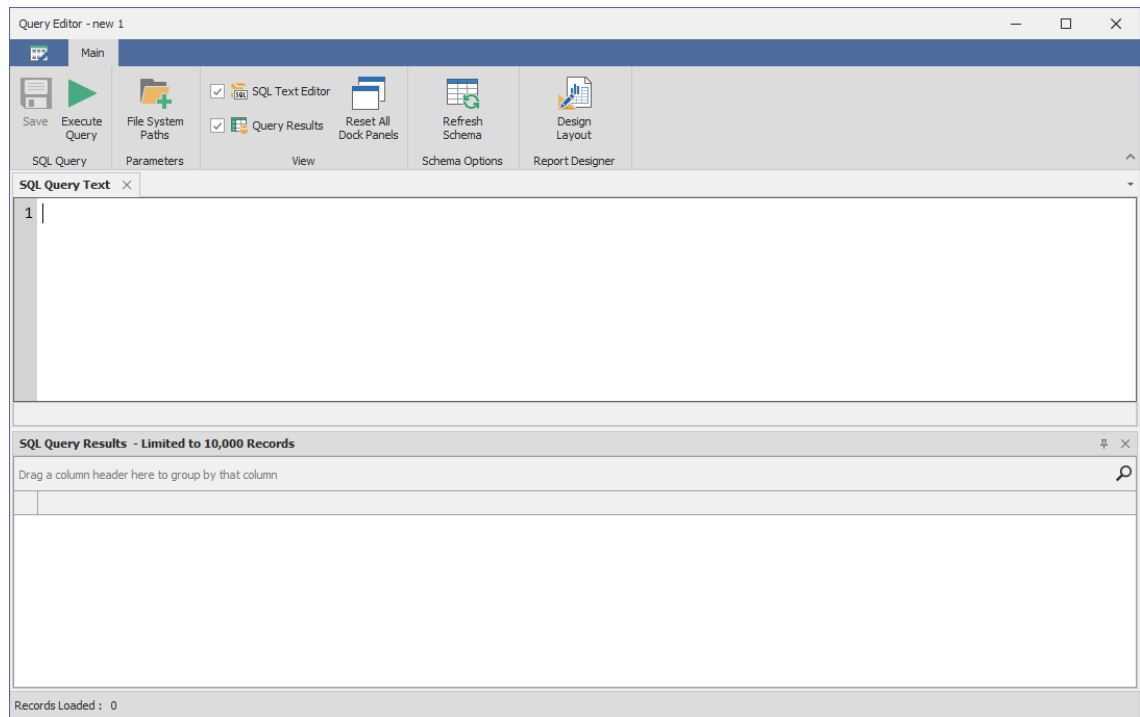

| Report Name                                   | Report Type    | Paths | Report Owner     | Last Modified    | Id |
|---|----------------|-------|------------------|------------------|----|
| No i...                                       | = Custom Query | =     | gc               | =                | =  |
| ATL SFO duplicate hash                        | Custom Query   | 2     | sp\administrator | 2/24/2022 6:4... | 3  |
| Owner report using cq paths and ad.ds_objects | Custom Query   | 1     | sp\administrator | 2/11/2022 4:4... | 1  |

All of your saved Custom Query reports are listed.

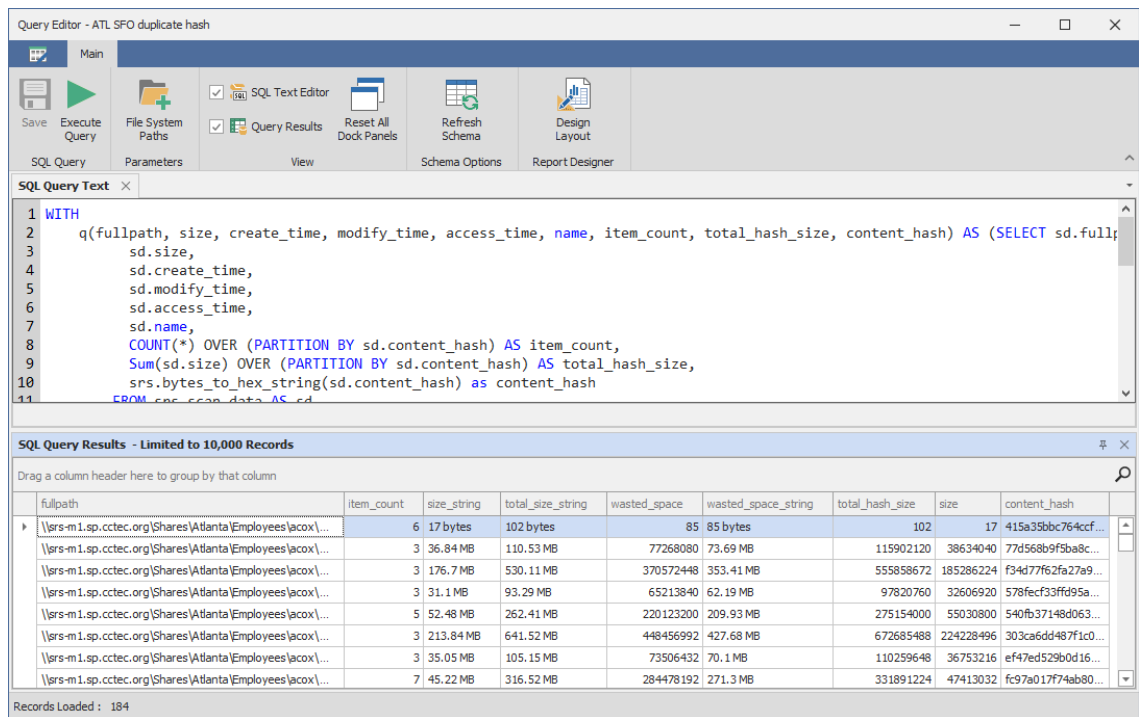

- 5 Click **New Custom Query**, give it a name, then click **Create**.

The Report Designer Query Editor is launched.

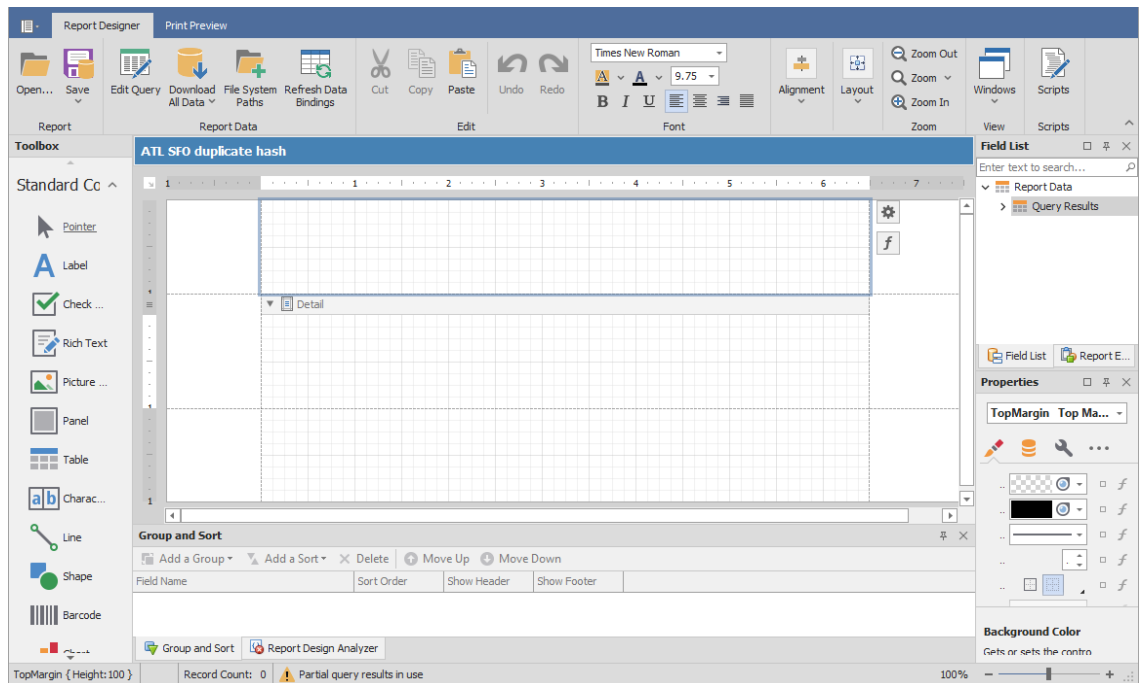

- 6 From the text editor you used in Step 2, copy the custom query and paste it into the Query Editor.
- 7 In the line beginning with `WHERE`, edit the UNC paths so that they are specific to the content file hashed shares on which you want to report.  

The custom query only includes two paths so if you want more, extend the line to include more paths by adding `srs.path_hash('\\\\server\share\path')` to the comma delimited `sd.fullpath_hash IN` portion of the where clause for each desired path.
- 8 (Conditional) At the bottom of the custom query, modify the `q.item_count` and `q.size` settings to the minimum number of duplicates and file sizes (in bytes), respectively, to include in the report.
- 9 Click **Execute** to see a preview of the report data.

- 10 Click **Save**.
- 11 Click **Design Layout**.

- 12 Click **Open**.
- 13 Locate the `.rptx` file that you saved and unzipped in Step 2 and click **Open**.  
The layout template appears in the Report Designer.
- 14 Click **Download All Data**.

15 In the subsequent dialog box, click **Yes**.

This runs the query in the database and loads data into the report template.

16 Click **Print Preview** to review the report findings.

Note how the hashes are listed with a total number for each and the location of each, meaning the total number of duplicate files and their locations.

17 Save the report by doing one of the following:

- ♦ From the **Export To** drop-down menu, select the file type you want to save the report layout to.
- ♦ Click **Save Report** to save the report as a .PRNX file that you can open in the Report Viewer and if you want later, export the report to the desired file type.

## 4.2 Microsoft 365 Reports

- ♦ [Section 4.2.1, “Determining Prerequisites,” on page 31](#)
- ♦ [Section 4.2.2, “Designing the Report,” on page 31](#)

Once Agent365 has scanned the data and associated permissions for Microsoft 365 file repositories, including OneDrive for Business, SharePoint Online document libraries, and Teams document libraries, you can use the pre-built custom queries and associated report layouts in <https://filequerycookbook.com> to generate reports.

### 4.2.1 Determining Prerequisites

- ♦ Install and configure Agent365. See [Agent365](#) in the *File Reporter 4.1 Installation Guide*.
- ♦ Scan the tenant. See [Tenants](#) in the *File Reporter 4.1 Administration Guide*.
- ♦ Install the Client Tools. See [Installing the Client Tools](#) in the *File Reporter 4.1 Client Tools Guide*.

### 4.2.2 Designing the Report

The Client Tools include the Report Designer application that will be used in these procedures.

- 1 Using File Query Cookbook located at <https://filequerycookbook.com>, locate and download one of the custom queries and associated reports for Microsoft 365.  
The file is saved as a zip archive.
- 2 Unzip the downloaded file and open the .sql file in a text editor.  
You will eventually paste this custom query into the Query Editor.
- 3 From the Start menu, launch the File Reporter 4.1 Report Designer.

Login

| Owner report using cq paths and ad.ds_objects | Custom Query   | 1     | sp\administrator | 2/11/2022 4:4... | 1  |  |

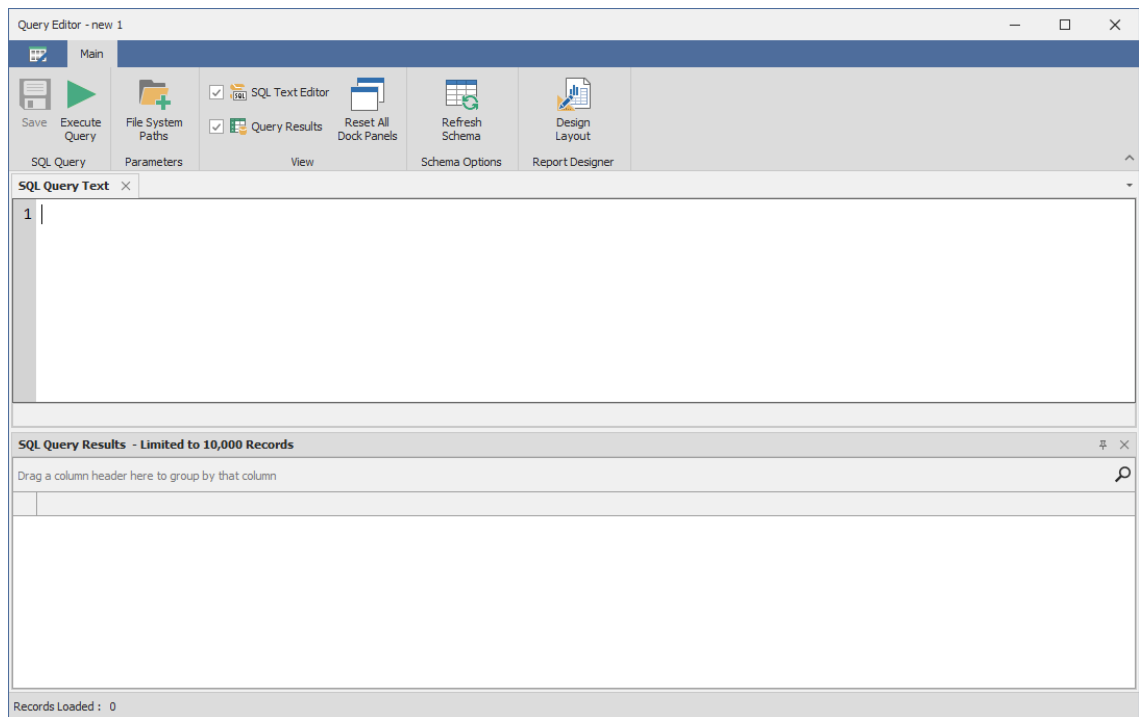

Report Type = Custom Query Edit Filter

All of your saved Custom Query reports are listed.

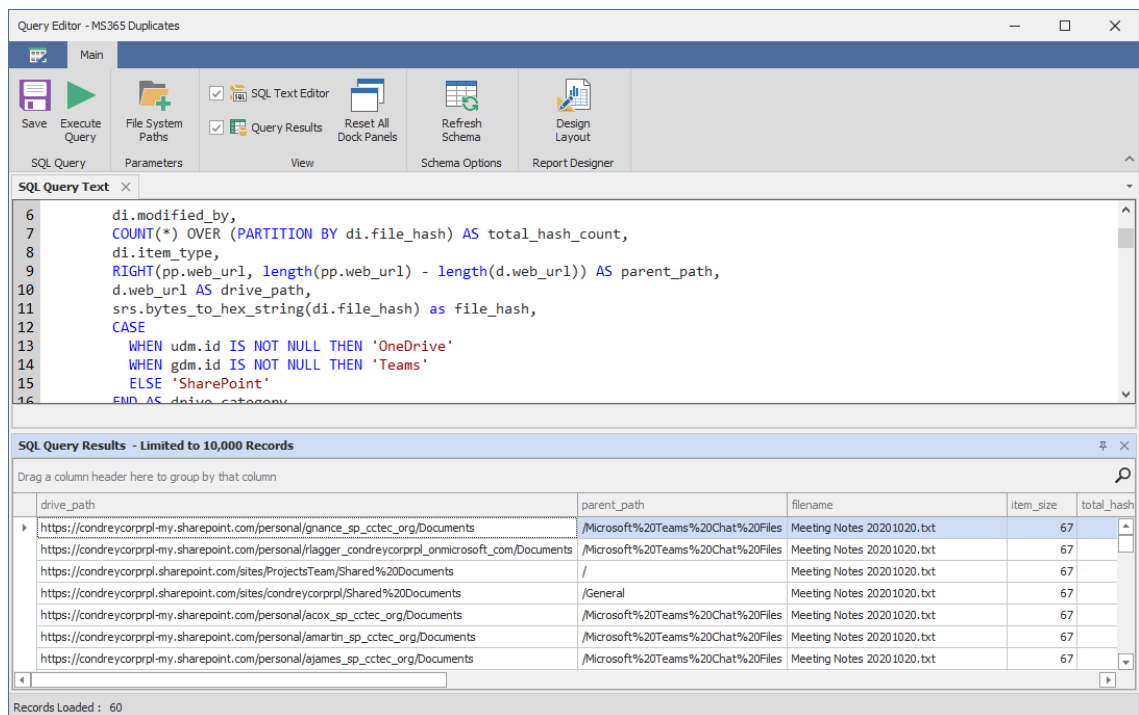

5 Click **New Custom Query**, give it a name, then click **Create**.

The Report Designer Query Editor is launched.

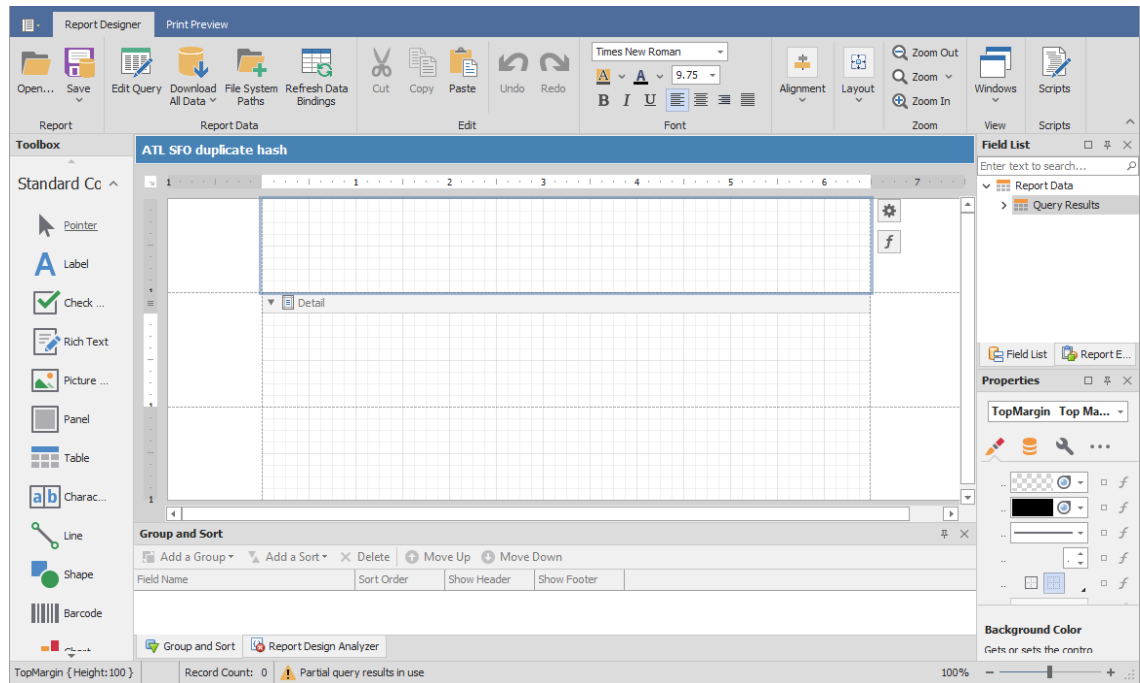

- 6 From the text editor you used previously to unzip the downloaded file and open the .sql file in a text editor, copy the custom query and paste it into the Query Editor.
- 7 (Conditional) If there are target paths or other modifications that need to be made for your environment, follow the procedures for the recipe.
- 8 Click **Execute** to get a preview of the report data in the bottom portion of the editor.

- 9 Click **Save**.

## 10 Click Design Layout.

### 11 Click **Open**.

### 12 Locate the `.rpx` file that you saved and unzipped previously and click **Open**.

The layout template appears in the Report Designer.

### 13 Click **Download All Data**.

### 14 In the subsequent dialog box, click **Yes**.

This runs the query in the database and loads data into the report template.

### 15 Click **Print Preview** to review the report findings.

### 16 Save the report by doing one of the following:

- ◆ From the **Export To** drop-down menu, select the file type you want to save the report as.
- ◆ Click **Save Report** to save the report as a `.prnx` file that you can open in the Report Viewer and if you want later, export the report to the desired file type.

## 4.3 Active Directory Identity Enrichment

- ◆ [Section 4.3.1, “Determining Prerequisites,” on page 34](#)
- ◆ [Section 4.3.2, “Designing the Report,” on page 35](#)

Starting with File Reporter 4.1 you can now provide extended data for identities in Custom Query reports or create identity reports for security principals in Active Directory.

### 4.3.1 Determining Prerequisites

- ◆ File Reporter collects Active Directory identity data once per day by default.

For instructions on running a collection manually, see [Active Directory Identity Scans](#) in the *File Reporter 4.1 Administration Guide*.

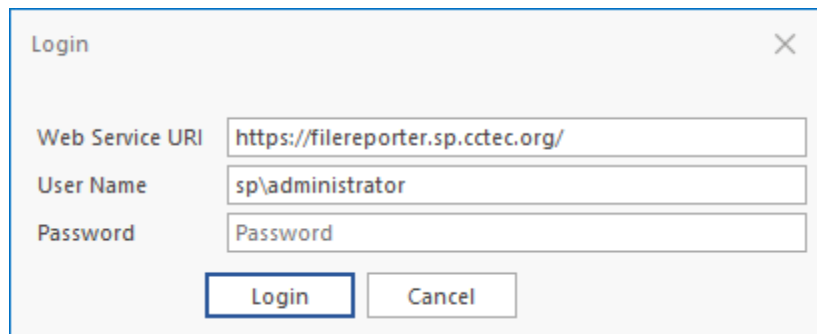

- ♦ Decide whether you wish to extend an existing Custom Query file system metadata or permissions report or if you wish to report just on Active Directory identities themselves.
  - ♦ If extending an existing Custom Query report, determine whether that report data already includes the owner or permissions trustee Security Identifiers (SIDs) or GUIDs.
  - ♦ If reporting solely on Active Directory identities, determine which of the extended attributes to include in the report.

See the table and view definitions for details on available attributes.

## 4.3.2 Designing the Report

This example extends a “Direct User Assignment” Custom Query report which identifies user accounts that have been assigned permissions directly to folders (as opposed to using group membership) and shows a summary of the count of direct permissions per user by share path.

- 1 From the **Start** menu, launch the File Reporter 4.1 Report Designer.

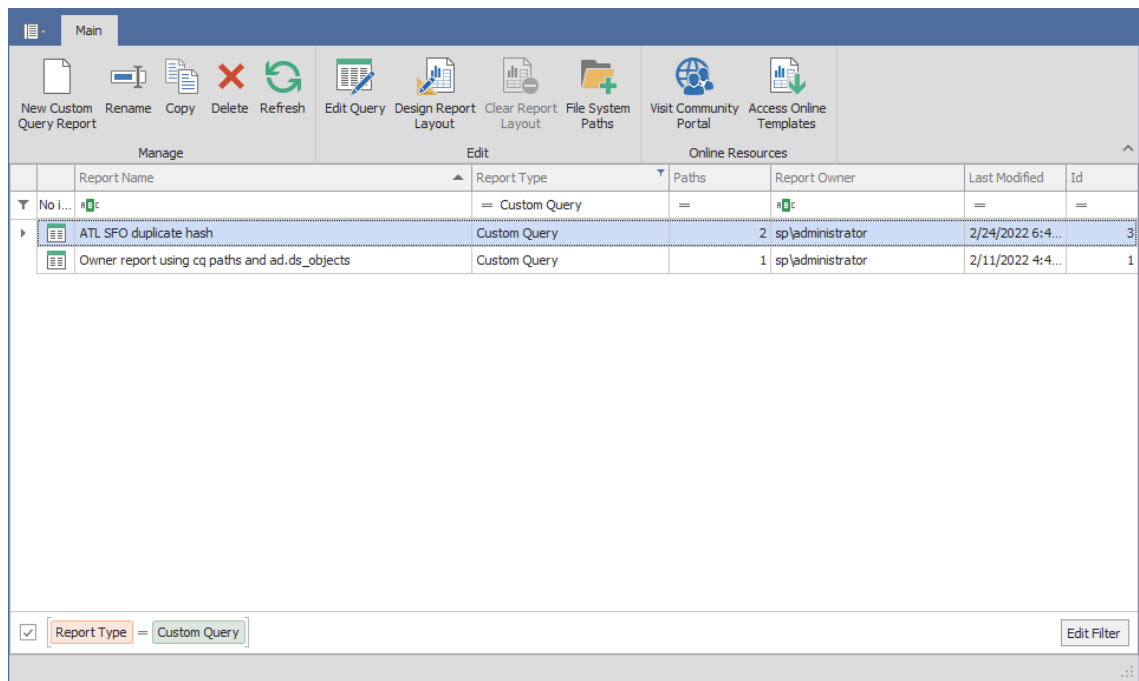

The screenshot shows a 'Login' dialog box with the following fields and values:

| Field           | Value                             |
|-----------------|-----------------------------------|
| Web Service URI | https://filereporter.sp.ctec.org/ |
| User Name       | sp\administrator                  |
| Password        | Password                          |

Buttons: Login, Cancel

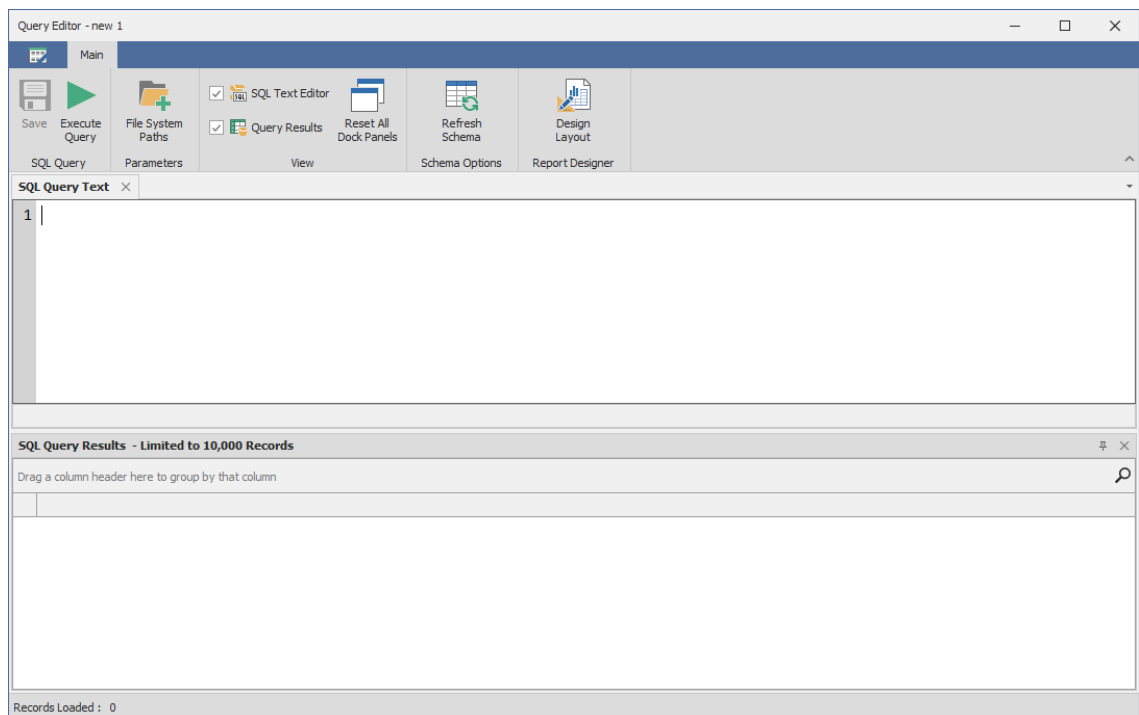

- 2 Enter the login credentials and click **Login**.

All of your saved Custom Query reports are listed.

- 3 Click **New Custom Query**, give it a name, then click **Create**.

The Report Designer Query Editor is launched.

- 4 Enter the following SQL statements into the Query Editor:

**Basic Query - User Direct Permissions Summary**

```

1  SELECT
2     ace.trustee_display_name,
3     ace.scan_target,
4     COUNT(*) AS ace_count
5  FROM srs.current_ntfs_aces AS ace
6  WHERE ace.trustee_type = 1
7         AND ace.ace_flags & 16 <> 16
8  GROUP BY
9     ace.trustee_display_name,
10    ace.scan_target

```

5 Click **Execute** to see a preview of the report data.

This query will produce a basic result similar to the following:

The screenshot shows a SQL Query Editor window titled "Query Editor - User Direct Permissions Summary". The window has a menu bar with "Main" and a toolbar with icons for Save, Execute Query, File System Paths, SQL Text Editor, Query Results, Reset All Dock Panels, Refresh Schema, and Design Layout. The SQL Query Text area contains the following query:

```

1  SELECT
2     ace.trustee_display_name,
3     ace.scan_target,
4     COUNT(*) AS ace_count
5  FROM srs.current_ntfs_aces AS ace
6  WHERE ace.trustee_type = 1
7         AND ace.ace_flags & 16 <> 16
8  GROUP BY ace.trustee_display_name, ace.scan_target

```

Below the query editor is the "SQL Query Results - Limited to 10,000 Records" section. It shows a table with the following data:

| trustee_display_name | scan_target                  | ace_count |
|----------------------|------------------------------|-----------|
| SP\BEN_M_STIEL178    | \\srs-m1.sp.cctec.org\Shares | 2         |
| SP\BIB_V_SONNE757    | \\srs-m1.sp.cctec.org\Shares | 2         |
| SP\BIG_V_BATTL425    | \\srs-m1.sp.cctec.org\Shares | 2         |
| SP\acox              | \\srs-m1.sp.cctec.org\Shares | 1         |
| SP\ADA_W_MOECK784    | \\srs-m1.sp.cctec.org\Shares | 2         |
| SP\DEL_N_FANE330     | \\srs-m1.sp.cctec.org\Shares | 2         |
| SP\ADEN_BOHNE231     | \\srs-m1.sp.cctec.org\Shares | 2         |
| SP\ADIL_K_SATER861   | \\srs-m1.sp.cctec.org\Shares | 2         |

Records Loaded : 1,044

6 Click **Save** to save the SQL entered so far.

7 Augment the data by joining with the `ad.ds_objects` table to include the Active Directory user `display_name` and `title` fields.

### Enhanced Query - User Direct Permissions Summary

```

1  SELECT
2     dso.display_name,
3     dso.title,
4     ace.trustee_display_name,
5     ace.scan_target,
6     COUNT(*) AS ace_count
7  FROM srs.current_ntfs_aces AS ace
8  JOIN ad.ds_objects AS dso
9     ON dso.object_sid = ace.sid
10 WHERE ace.trustee_type = 1
11 AND ace.ace_flags & 16 <> 16
12 GROUP BY
13     ace.trustee_display_name,
14     ace.scan_target,
15     dso.display_name,
16     dso.title

```

8 Click **Execute** and see the updated results that include the `title` and `display_name` fields.

The screenshot shows the 'Query Editor - User Direct Permissions Summary' window. The 'SQL Query Text' pane contains the following query:

```

1 SELECT dso.display_name,
2     dso.title,
3     ace.trustee_display_name,
4     ace.scan_target,
5     COUNT(*) AS ace_count
6 FROM srs.current_ntfs_aces AS ace
7 JOIN ad.ds_objects AS dso ON dso.object_sid = ace.sid
8 WHERE ace.trustee_type = 1
9 AND ace.ace_flags & 16 <> 16
10 GROUP BY ace.trustee_display_name, ace.scan_target, dso.display_name, dso.title

```

The 'SQL Query Results - Limited to 10,000 Records' pane displays the following table:

| display_name   | title       | trustee_display_name | scan_target                      | ace_count |
|----------------|-------------|----------------------|----------------------------------|-----------|

## ms365.sharing\_link\_members

| Column Name        | SQL Server    | PostgreSQL   | Notes   |
|--------------------|---------------|--------------|---|
| id                 | bigint        | bigint       | Primary key   |
| permission_id      | bigint        | bigint       | Reference to primary key in ms365.permissions                             |
| scan_id            | bigint        | bigint       | Reference to primary key in ms365.drive_scans                             |
| site_collection_id | bigint        | bigint       | Reference to primary key in ms365.sites for the site collection root site |
| ms365_id           | nvarchar(256) | varchar(256) | Unique id provided by MS GraphAPI for the associated member               |
| member_type        | integer       | integer      | 0 - Direct membership<br>1 - Transitive (nested membership)               |
| display_name       | nvarchar(256) | varchar(256) | Friendly name of member   |

| Column Name     | SQL Server    | PostgreSQL   | Notes   |
|-----------------|---------------|--------------|---|
| email           | nvarchar(256) | varchar(256) | Email address of member   |
| sp_group_id     | integer       | integer      | Reference to an associated SharePoint site collection's group account |
| sp_user_id      | integer       | integer      | Reference to an associated SharePoint site collection's user account  |
| sp_login_name   | nvarchar(256) | varchar(256) | SharePoint-specific login name for the member                         |
| sp_display_name | nvarchar(256) | varchar(256) | Friendly name of member's associated SharePoint account               |

## ms365.sites

| Column Name        | SQL Server    | PostgreSQL   | Notes   |
|--------------------|---------------|--------------|---|
| id                 | bigint        | bigint       | Primary key   |
| job_id             | int           | int          | Reference to primary key in ms365.jobs                                    |
| tenant_id          | int           | int          | Reference to primary key in ms365.tenants                                 |
| site_collection_id | bigint        | bigint       | Reference to primary key in ms365.sites for the site collection root site |
| last_update        | datetime2(3)  | timestamp    | Last update time for database entry                                       |
| ms365_id           | nvarchar(256) | varchar(256) | Unique id provided by MS GraphAPI   |
| ms365_parent_id    | nvarchar(256) | varchar(256) | Unique id provided by MS GraphAPI for the associated parent site          |
| display_name       | nvarchar(256) | varchar(256) | Friendly name of SharePoint site  |
| name               | nvarchar(256) | varchar(256) | Site name   |
| is_root            | bit           | boolean      | true = root site (no parent sites)<br>false = child site                  |
| web_url            | nvarchar(max) | text         | Full path to SharePoint site  |

## ms365.sp\_base\_permissions

| Column Name | SQL Server     | PostgreSQL    | Notes                       |
|-------------|----------------|---------------|-----------------------------|
| flag        | bigint         | bigint        | Base permissions flag value |
| name        | nvarchar(64)   | varchar(64)   | Flag entry name             |
| description | nvarchar(1024) | varchar(1024) | Flag entry description      |

This is a pre-populated lookup table.

Values are derived from SharePoint client and server .NET APIs.

## 5.4.1 srs.access\_mask\_basic\_string

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @mask        | integer       | integer      |
| @path_type   | integer       | integer      |
| Return Value | nvarchar(128) | varchar(128) |

**Description:** Converts an NTFS access mask value to its basic permissions string equivalent.

Note that the values displayed here are functionally equivalent to what is seen in the primary window of the security tab for an NTFS file system entry.

- ◆ Entries having permissions that do not fit the basic permissions (such as Special permissions) include an asterisk \*.
- ◆ The path\_type is required since the same flags represent different semantic values for folders, files and shares. Path type must be one of 1 (file), 2 (folder) or 7 (share).
- ◆ Permissions flags are mapped to one or more of the following values:
  - ◆ Full Control
  - ◆ Modify
  - ◆ Read & Execute
  - ◆ List Folder Contents (Folders only)
  - ◆ Read
  - ◆ Write
  - ◆ Special Permissions

## Example (SQL Server)

```
1 | SELECT TOP(100)
2 |     sd.fullpath,
3 |     srs.access_mask_basic_string(ntfs.access_mask, 2) AS basic_permissions
4 | FROM srs.ntfs_aces AS ntfs
5 | JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id
6 | WHERE sd.path_type = 2;
```

## Example (PostgreSQL)

```
1 | SELECT
2 |     sd.fullpath,
3 |     srs.access_mask_basic_string(ntfs.access_mask, 2) AS basic_permissions
4 | FROM srs.ntfs_aces AS ntfs
5 | JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id
6 | WHERE sd.path_type = 2
7 | LIMIT 100;
```

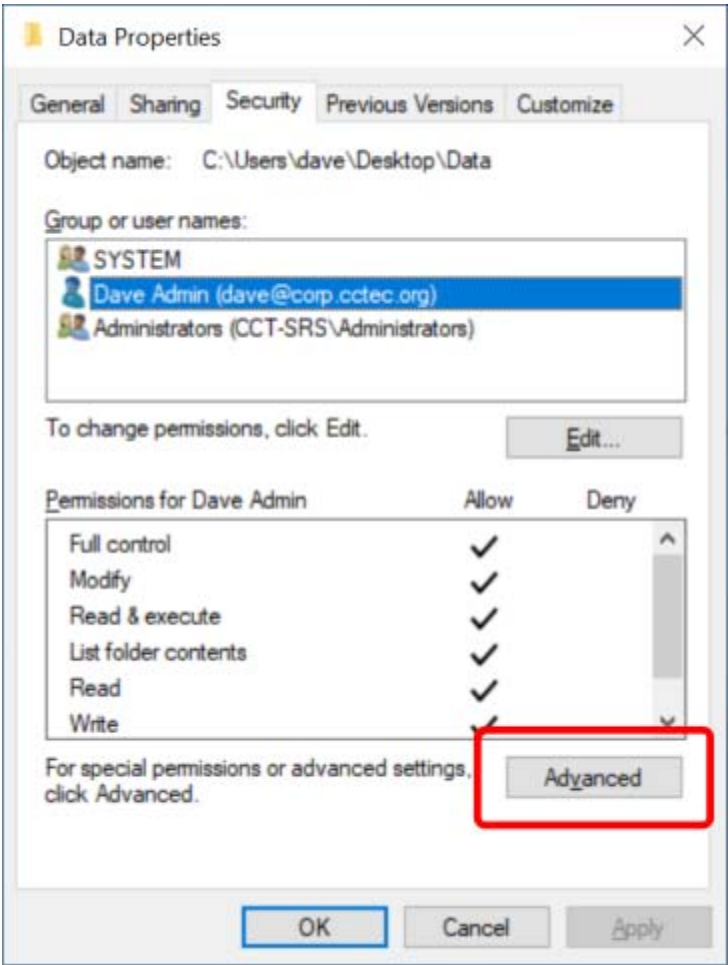

## 5.4.2 srs.access\_mask\_string

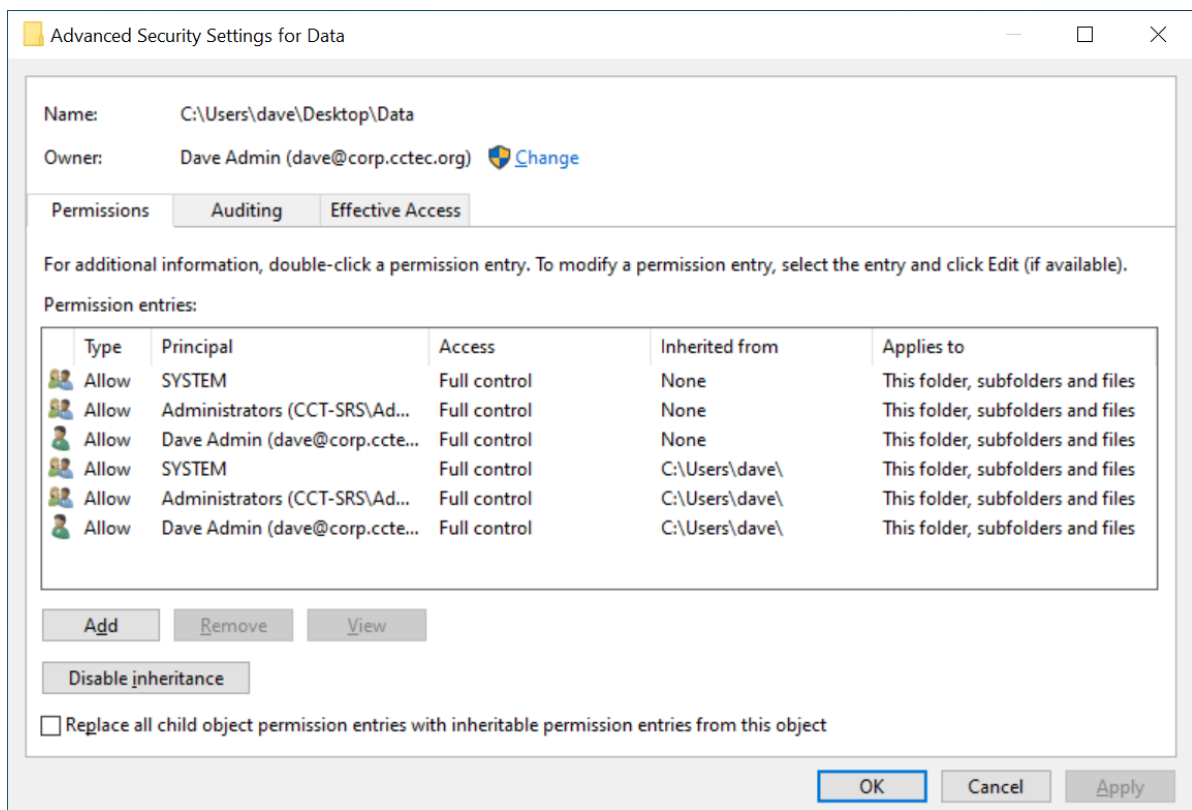

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @mask        | integer       | integer      |
| @path_type   | integer       | integer      |
| Return Value | nvarchar(128) | varchar(128) |

**Description:** Converts an NTFS access mask value to its advanced permissions string equivalent.

Note that the values displayed here are functionally equivalent to what is seen in the advanced section of the security tab for an NTFS file system entry.

- ◆ The path\_type is required since the same flags represent different semantic values for folders, files and shares. Path type must be one of 1 (file), 2 (folder) or 7 (share).
- ◆ Flags correspond to the following values:

|            |         |                                   |
|------------|---------|-----------------------------------|
| 0x00000001 | Rd / Lf | Read data / List folder           |
| 0x00000002 | Wd / Cf | Write data / Create file          |
| 0x00000004 | Ad / Cs | Append data / Create subdirectory |
| 0x00000008 | Rx      | Read extended attributes          |
| 0x00000010 | Wx      | Write extended attributes         |
| 0x00000020 | Xf / Tf | File execute / Traverse           |
| 0x00000040 | Ds      | Delete child (subdirectory)       |
| 0x00000080 | Ra      | Read attributes                   |
| 0x00000100 | Wa      | Write attributes                  |

| 0x01000000 | Ss | Access system security |
| 0x10000000 | Ga | Generic All            |
| 0x20000000 | Ge | Generic Execute        |
| 0x40000000 | Gw | Generic Write          |
| 0x80000000 | Gr | Generic Read           |

### Example (SQL Server)

```

1 | SELECT TOP(100)
2 |     sd.fullpath,
3 |     srs.access_mask_string(ntfs.access_mask, sd.path_type) AS access_mask
4 | FROM srs.ntfs_aces AS ntfs
5 | JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id;

```

### Example (PostgreSQL)

```

1 | SELECT
2 |     sd.fullpath,
3 |     srs.access_mask_string(ntfs.access_mask, sd.path_type) AS access_mask
4 | FROM srs.ntfs_aces AS ntfs
5 | JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id
6 | LIMIT 100;

```

## 5.4.3 srs.ace\_flags\_string

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @flags       | integer       | integer      |
| Return Value | nvarchar(128) | varchar(128) |

**Description:** Converts the access mask flags to a string representation. Flags are converted as follows:

|       |      |                   |
|-------|------|-------------------|
| 0x001 | (OI) | Object inherit    |
| 0x002 | (CI) | Container inherit |
| 0x004 | (NP) | No propagate      |
| 0x008 | (IO) | Inherit only      |
| 0x010 | (ID) | Inherited         |
| 0x040 | (SA) | Successful access |
| 0x080 | (FA) | Failed access     |

## Example (SQL Server)

```
1 | SELECT TOP(100)
2 |     sd.fullpath,
3 |     srs.access_mask_string(ntfs.access_mask, sd.path_type) AS access_mask,
4 |     srs.ace_flags_string(ntfs.flags) AS ace_flags
5 | FROM srs.ntfs_aces AS ntfs
6 | JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id;
```

## Example (PostgreSQL)

```
1 | SELECT
2 |     sd.fullpath,
3 |     srs.access_mask_string(ntfs.access_mask, sd.path_type) AS access_mask,
4 |     srs.ace_flags_string(ntfs.flags) AS ace_flags
5 | FROM srs.ntfs_aces AS ntfs
6 | JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id
7 | LIMIT 100;
```

### 5.4.4 srs.ace\_type\_string

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @ace_type    | integer       | integer      |
| Return Value | nvarchar(128) | varchar(128) |

**Description:** Converts the access mask type value to a corresponding text value.

Flags correspond as follows:

|    |                     |
|----|---------------------|
| 0  | Access Allowed      |
| 1  | Access Denied       |
| 2  | System Audit        |
| 3  | System Alarm        |
| 4  | Allowed Compound    |
| 5  | Allowed Object      |
| 6  | Denied Object       |
| 7  | System Audit Object |
| 8  | System Alarm Object |
| 9  | Allowed Callback    |
| 10 | Denied Callback     |

|    |                              |
|----|------------------------------|
| 11 | Allowed Callback Object      |
| 12 | Denied Callback Object       |
| 13 | System Audit Callback        |
| 14 | System Alarm Callback        |
| 15 | System Audit Callback Object |
| 16 | System Alarm Callback Object |
| 17 | System Mandatory Label       |

For NTFS file systems the primary values of concern are Allowed (0), Denied (1), Audit (2), and System Mandatory Label (17).

### Example (SQL Server)

```

1 SELECT TOP(100)
2   sd.fullpath,
3   srs.access_mask_string(ntfs.access_mask, sd.path_type) AS access_mask,
4   srs.ace_flags_string(ntfs.flags) AS ace_flags,
5   srs.ace_type_string(ntfs.ace_type) AS ace_type
6 FROM srs.ntfs_aces AS ntfs
7 JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id;

```

### Example (PostgreSQL)

```

1 SELECT sd.fullpath,
2   srs.access_mask_string(ntfs.access_mask, sd.path_type) AS access_mask,
3   srs.ace_flags_string(ntfs.flags) AS ace_flags,
4   srs.ace_type_string(ntfs.ace_type) AS ace_type
5 FROM srs.ntfs_aces AS ntfs
6 JOIN srs.scan_data AS sd ON sd.id = ntfs.scan_data_id
7 LIMIT 100;

```

## 5.4.5 srs.ad\_account\_name

| Parameters   | SQL Server     | PostgreSQL    |
|--------------|----------------|---------------|
| @domain      | nvarchar(1024) | varchar(1024) |
| @name        | nvarchar(1024) | varchar(1024) |
| @sid         | binary(68)     | bytea         |
| Return Value | nvarchar(max)  | text          |

**Description:** Description: Converts primary naming values for an Windows security principal to a display name.

- ♦ If domain is null or empty, the leading backslash is not included in the result

- ♦ If the name is null or empty, the result value is the SDDL sid representation
- ♦ If the sid is needed but is invalid, the return value is [Invalid SID]

### Example - Domain and Name

```
1 | SELECT srs.ad_account_name('BUILTIN', 'Administrators', null);
```

### Example - SID

```
1 |
2 | SELECT srs.ad_account_name("", "", 0x01020000000000052000000020020000);
```

## 5.4.6 srs.attribute\_string

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @flags       | integer       | integer      |
| Return Value | nvarchar(256) | varchar(256) |

**Description:** Converts an attributes value to its equivalent string representation. Flags correspond to the following values:

|            |    |                          |
|------------|----|--------------------------|
| 0x00000000 |    | None                     |
| 0x00000001 | Ro | Read Only                |
| 0x00000002 | Ar | Archive                  |
| 0x00000004 | Sy | System                   |
| 0x00000008 | Hi | Hidden                   |
| 0x00000010 | Dr | Directory                |
| 0x00000020 | Co | Compressed               |
| 0x00000040 | Ol | Offline                  |
| 0x00000080 | De | NTFS device              |
| 0x00000100 | No | NTFS Normal              |
| 0x00000200 | Te | NTFS Temporary           |
| 0x00000400 | Sp | NTFS Sparse File         |
| 0x00000800 | Rp | NTFS Reparse Point       |
| 0x00001000 | Nc | NTFS Not content indexed |
| 0x00002000 | En | NTFS Encrypted           |
| 0x00004000 | Vi | NTFS Virtual             |

## Example (SQL Server)

```
1 | SELECT TOP(100)
2 |     fullpath,
3 |     srs.attribute_string(attributes)
4 | FROM srs.scan_data;
```

## Example (PostgreSQL)

```
1 | SELECT
2 |     fullpath,
3 |     srs.attribute_string(attributes)
4 | FROM srs.scan_data
5 | LIMIT 100;
```

### 5.4.7 srs.byte\_string

| Parameters   | SQL Server   | PostgreSQL |
|--------------|--------------|------------|
| @size        | bigint       | bigint     |
| Return Value | nvarchar(64) | text       |

**Description:** Converts a size value to a string representation of the closest unit.

- ♦ The return value has a maximum precision of two decimal places.
- ♦ Units include kilobyte (KB), megabyte (MB), gigabyte (GB), terabyte (TB), petabyte (PB), and exabyte (EB).

#### Example

```
1 | SELECT srs.byte_string(1287168);
```

### 5.4.8 srs.byte\_unit\_string

| Parameters   | SQL Server   | PostgreSQL  |
|--------------|--------------|-------------|
| @size        | bigint       | bigint      |
| @unit        | nvarchar(10) | varchar(10) |
| @precision   | integer      | integer     |
| Return Value | nvarchar(64) | text        |

**Description:** Converts a number to a string representation of the specified unit with the specified precision.

- ◆ The specified precision is limited to a value from 0 to 3. Values outside this range will be adjusted to 0 or 3 accordingly.
- ◆ Unit specifiers are case insensitive and include:
  - ◆ byte
  - ◆ KB (kilobyte)
  - ◆ MB (megabyte)
  - ◆ GB (gigabyte)
  - ◆ TB (terabyte)
  - ◆ PB (petabyte)
  - ◆ EB (exabyte)

```
1 | SELECT srs.byte_unit_string(1287168, 'KB', 3)
```

## 5.4.9 srs.bytes\_to\_hex\_string

| Parameters     | SQL Server     | PostgreSQL |
|----------------|----------------|------------|
| @byte_sequence | varbinary(max) | bytea      |
| Return Value   | nvarchar(max)  | text       |

**Description:** Converts a byte sequence to its equivalent hex string representation.

- ◆ Returned hex string is lower case with no separators and no prefix.

### Example

```
1 | SELECT
2 |   srs.bytes_to_hex_string(ad.sid)
3 | FROM srs.ad_objects AS ad;
```

## 5.4.10 srs.guid\_bytes

| Parameters   | SQL Server    | PostgreSQL  |
|--------------|---------------|-------------|
| @guid_text   | nvarchar(38)  | varchar(38) |
| Return Value | varbinary(16) | bytea       |

**Description:** Converts a compatible GUID text string to its equivalent binary representation.

Recommended input format: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx

- ◆ Surrounding curly braces are optional
- ◆ Hex values A-F may be in upper or lower case
- ◆ Hyphen separators must be present at the specified 4 locations or not at all

### Example

```
1 | SELECT srs.guid_bytes('12345678-1234-5678-9abc-123456789abc');
```

## 5.4.11 srs.guid\_text

| Parameters   | SQL Server    | PostgreSQL  |
|--------------|---------------|-------------|
| @guid_binary | varbinary(16) | bytea       |
| Return Value | nvarchar(36)  | varchar(36) |

**Description:** Converts a binary GUID value to its equivalent string representation.

Note that returned strings are in the canonical lower-case GUID format xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.

### Example

```
1 | SELECT fdn, srs.guid_text(guid) FROM srs.ad_objects WHERE id=1;
```

## 5.4.12 srs.hex\_string\_to\_bytes

| Parameters     | SQL Server     | PostgreSQL |
|----------------|----------------|------------|
| @byte_sequence | varbinary(max) | bytea      |
| Return Value   | nvarchar(max)  | text       |

**Description:** Converts a hex string to its equivalent bytes.

- ◆ Hex values A-F may be in upper or lower case.
- ◆ Hex string must be a proper string with an even number of characters — leading zeros are required for each hex value having a single digit.
- ◆ Do not include separators such as hyphens between hex values.

### Example

```
1 | SELECT srs.hex_string_to_bytes('01ab3d4407');
```

## 5.4.13 srs.path\_hash

| Parameters   | SQL Server    | PostgreSQL |
|--------------|---------------|------------|
| @path        | nvarchar(max) | text       |
| Return Value | binary(20)    | bytea      |

**Description:** Returns the binary SHA-1 hash for a given path.

- ◆ The input path is first converted to lower case
- ◆ The input path is then converted to byte representation using the default text encoding of the database for string values (typically UTF-8 on PostgreSQL, and Unicode UCS-2 on SQL Server)
- ◆ Useful for finding a path in the srs.scan\_data table using the fullpath\_hash indexed column

### Example

```
1 | SELECT * FROM srs.scan_data
2 | WHERE fullpath_hash = srs.path_hash('\\server-1.ad.cctec.org\Users\user1');
```

## 5.4.14 srs.path\_hash\_sha256

| Parameters   | SQL Server    | PostgreSQL |
|--------------|---------------|------------|
| @path        | nvarchar(max) | text       |
| Return Value | binary(32)    | bytea      |

**Description:** Returns the binary SHA256 hash for a given path.

- ◆ The input path is first converted to lower case
- ◆ The input path is then converted to byte representation using the default text encoding of the database for string values (typically UTF-8 on PostgreSQL, and Unicode UCS-2 on SQL Server)
- ◆ Useful for finding a path (web URL) in the ms365.drive\_items table using the web\_url\_hash indexed column

### Example

```
1 | SELECT * FROM ms365.drive_items
2 | WHERE web_url_hash = srs.path_hash_sha256('https://mysite.sharepoint.com/sites/Shared
```

## 5.4.15 srs.sid\_bytes

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @sid         | nvarchar(256) | varchar(256) |
| Return Value | varbinary(68) | bytea        |

**Description:** Converts an SDDL representation of a Security Identifier value to its binary form.

- ◆ Input SID values must be in proper SDDL form

### Example

```
1 | SELECT * FROM srs.ad_objects WHERE srs.sid_bytes('S-1-5-32-544') = sid;
```

## 5.4.16 srs.sid\_text

| Parameters   | SQL Server    | PostgreSQL   |
|--------------|---------------|--------------|
| @sid_bytes   | varbinary(68) | bytea        |
| Return Value | nvarchar(256) | varchar(256) |

**Description:** Converts a binary Security Identifier to its SDDL string representation.

### Example

```
1 | SELECT domain, name, srs.sid_text(sid) FROM srs.ad_objects;
```
